Re: Kuhlman Electric Corporation site, Crystal Springs, MS
Williams, et al. v. Kuhlman Corporation, et al., In the Circuit
Court for the First Judicial District of Hinds County, Mississippi CA# 251-03-000102-CIV

Dear Mr. Russell:

We represent Maggie Tanner Williams, individually and on behalf of her deceased husband, T. J. Williams, 106 Puckett Street, Crystal Springs, Mississippi. During our investigation of the Williams' claims, our experts at 3TM International, Inc. found PCB concentrations above the state remediation standard of 1 ppm in the soil at the Williams' home. Enclosed is a copy of 3TM's Report, PCB Litigation, Crystal Springs, MS, dated December 18, 2001. We have flagged the pertinent pages for your review.

Please advise whether or not MDEQ has ordered or will order Kuhlman to remediate Mrs. Williams' yard, and if so, whether or not MDEQ will require Kuhlman to relocate Mrs. Williams and her household members during remediation activities. We specifically request that the inhabitants of her home be relocated during remediation as we have growing evidence in blood studies that our clients in Crystal Springs are subject to current and ongoing exposure to Arochlor 1260, the source of which can only be remedial activities by Kuhlman and its contractors. For that reason, we request MDEQ to require Kuhlman to relocate the inhabitants of Mrs. Williams' home during remediation activities at her residence to minimize human exposure.

We look forward to your reply. Please let us know if you need any further information.

Sincerely yours,

Mary E. McAlister

Enclosure

Re: PCB Litigation – Crystal Springs, Mississippi
3TM Project Reference: 3TM-DNA-102000-03
Summary Report: Soil & Indoor Dust Sampling Program
August 2001 Field Campaign
PCB Litigation – Crystal Springs, Mississippi

Dear Ms. McAlister:

3TM International, Inc. is pleased to submit our Summary Report for the soil and indoor dust sampling of various residences in Crystal Springs, Mississippi. This sampling was performed during the August 27 - 31, 2001 field campaign.

3TM International appreciates the opportunity to assist you on this work. If you have any questions, please feel free to call me.

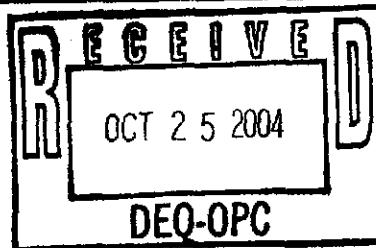

Sincerely,
3TM INTERNATIONAL, INC.

1.0 Introduction and Overview

This Report summarizes the results of the collection of soil and indoor dust samples from various residences surrounding the Kuhlman Electric facility in Crystal Springs, Mississippi.

Previous sampling of soils, sediments, and indoor dust conducted by 3TM International at or near residences surrounding the Kuhlman Electric facility indicated the presence of Polychlorinated Biphenyls (PCBs) and Dioxins.

Thus, the purpose of the August 2001 field program was to collect additional soil and indoor dust samples at various residences in Crystal Springs, Mississippi to further characterize the presence of PCBs.

The August 2001 field program was conducted during August 27 - 31, 2001, and consisted of collecting 149 soil samples at 9 residences (Soil Group). Indoor dust samples were also collected at a different group consisting of 9 residences (Dust Group), some of which were sampled for soils as well. All of the samples were tested for PCBs. None of the samples were tested for Dioxins or other chemicals.

The testing results indicated the presence of high levels of PCBs in the soil at a number of residences in Crystal Springs. Sample testing results indicated levels of PCB 1260 ranging from Below Reporting Limits (BRL) to as high as 1830 parts per billion (ppb). The current State of Mississippi Department of Environmental Quality (MDEQ) Tier 1 action level for PCBs is 1000 ppb (1 ppm).

The testing results also indicated the presence of high levels of PCBs in the indoor dust at 8 of the 9 residences. Total PCB results in the indoor dust ranged from BRL to 4220 parts per billion (ppb). Two of these samples, CMS-VC-025, collected at 407 Jackson Street, and CMS-VC-027, collected at 104 Forrest Street, indicated levels exceeding the MDEQ Tier 1 action level for PCBs of 1000 ppb.

2.0 Description of Soil Sampling

2.1 Soil Sampling Locations and Procedures

For purposes of this Report, the term "surface soil" is defined as the top layer of soil at a sampling location, generally from 0 to 18 inches below ground surface (bgs). All samples were collected using the standard procedures previously developed by 3TM International in previous field campaigns, and summarized below.

The sampling locations were determined by 3TM International prior to conducting the field campaign. Samples were collected at residences with prior environmental media testing and/or at residents with elevated blood testing results that indicated the presence of PCBs.

Soil samples were collected at the following residences in Crystal Springs, Mississippi (hereinafter referred to as the "Soil Group"):

- Site #1
302 McPherson Street
Crystal Springs, Mississippi
- Site #2
308 McPherson Street
Crystal Springs, Mississippi
- Site #3
300 A McPherson Street
Crystal Springs, Mississippi
- Site #4
106 Puckett Street
Crystal Springs, Mississippi
- Site #5
104 Puckett Street
Crystal Springs, Mississippi
- Site #6
105 Tucker Street
Crystal Springs, Mississippi
- Site #7
200 Moore Street
Crystal Springs, Mississippi

- ▶ Site #8
106 Moore Street
Crystal Springs, Mississippi
- ▶ Site #9
403 Jackson Street
Crystal Springs, Mississippi

Soil samples and indoor dust samples were collected at 302 McPherson Street. This location was selected for sampling due to elevated levels of PCB in the blood of its resident (Mrs. Ruby Smith). Mrs. Smith exhibited a PCB level of 7.2 parts per billion (ppb) in her blood.

Only soil samples were collected at 308 McPherson Street. This location was also selected for sampling due to elevated PCB levels in its resident's blood (Mrs. Lula Stovall). Mrs. Stovall exhibited a PCB level of 10.7 ppb in her blood.

Two soil samples were collected at 300 A McPherson Street. Samples collected at this location were collected because the resident indicated that Kuhlman had stockpiled soil at this location.

Only soil samples were collected at 106 Puckett Street. This location was selected for sampling due to elevated PCB levels in its resident's blood (Mrs. Maggie Tanner). Mrs. Tanner exhibited a PCB level of 18.8 ppb in her blood.

Only soil samples were collected at 104 Puckett Street. This location was selected for sampling due to elevated PCB levels in its resident's blood (Mrs. Zeddie Wilson). Mrs. Wilson exhibited a PCB level of 10.8 in her blood.

Only soil samples were collected at 105 Tucker Street. This location was selected due to previous indoor dust sampling results and elevated PCB levels in two of its resident's blood (Ester & Robert L. Terrell). Mr. Terrell exhibited a PCB level of 12.8 ppb in his blood, while Mrs. Terrell exhibited a PCB level of 5.9 ppb in her blood. Previous indoor dust sampling indicated a presence of 22 ppb PCB in household dust.

Only soil samples were collected at 200 Moore Street. Samples were collected at this location due to elevated PCB levels in its resident's blood (Mrs. Nina Ham). Mrs. Ham exhibited a PCB level of 14.2 ppb in her blood.

Only soil samples were collected at 106 Moore Street. Samples were collected at this location due to elevated PCB levels in its resident's blood (Henry and Annie Jackson). Mr. Jackson exhibited a PCB level of 12.9 ppb. Mrs. Jackson exhibited a PCB level of 10.7 ppb. The previously noted address for these residents was 102 and 103 Moore St. However, their actual address is 106 Moore St.

Soil samples and indoor dust samples were collected at 403 Jackson Street. This location was selected for sampling due to its proximity to the Kuhlman Facility.

This address has previously been tested for PCBs in various environmental media, including soil, indoor dust, and blood. Prior soil sampling revealed PCB levels as high as 0.609 ppm; both indoor dust and blood samples had been below reporting limits (BRL).

2.2 Decontamination of Soil Sampling Equipment

Sampling at each location was accomplished using only soil sampling equipment that had been properly decontaminated, in order to eliminate the possibility for cross-contamination. Upon completion of sampling at a location, the sampling tools were decontaminated by manually removing large portions of adhered soils, scrubbing with Alconox detergent (a phosphate free soap) and potable water, and final rinsing with de-ionized water. The sampler donned new latex gloves before collecting each sample. Care was taken to ensure the utmost integrity of the samples.

2.3 Documentation of Sample Collection

Each sampling point and each sample collected were documented in the field by the field supervisor by completing the following forms:

- Soil Sample Collection Logs that document the method of sample collection and various sample-specific aspects of the sample. Soil Sample Collection Logs include documentation of the project and sample point location, sample collection date and time, sample number, method of sample collection, type of soil, quantity of sample collected, sample depth, type of sample container and preservative, name of field supervisor, signature of field supervisor, and similar information. Soil Sample Collection Logs are presented in Appendix A.
- Site Sketches that document the approximate location of the sampling point. The Site Sketches are shown in Appendix B.
- Photographic representation is provided for each sampling location. Photographs are taken to pinpoint where samples were collected in the field. Photographs are presented in Appendix E.
- Analytical Testing Chain-of-Custody that documents the handling of samples submitted to Xenco Laboratories and Midwest Research Institute (MRI), during the collection, shipping, and testing process. The Xenco Chain-of-Custody forms are presented in Appendix F, along with the complete Xenco analytical testing results. The MRI Chain-of-Custody forms are presented in Appendix G, along with the complete MRI analytical testing results.

2.4 Analytical Testing Methodology

All soil samples were tested for Polychlorinated Biphenyls (PCBs) using EPA Method 8082 by Xenco Laboratories of Houston, Texas. The results of the analytical testing are summarized in Table 1 and Table 3. The complete Xenco analytical testing reports are presented in Appendix F.

3.0 Description of Indoor Dust Sampling

3.1 Methodology for the Collection of Indoor Dust Samples

Sampling of dust inside residences can be accomplished by a number of methods, including wipe sampling and vacuum sampling. Each method has advantages and disadvantages, depending on the intended use of the results. However, for this field campaign, 3TM International collected dust samples using the High Volume Small Surface Sampler (HVS-3) vacuum sampler. The collection of high integrity dust samples for environmental forensic chemical testing requires specialized sampling equipment, sampling protocols, and analytical testing, such as exist for the HVS-3 system.

The HVS-3 was developed by Envirometrics, Inc. and Engineering Plus, Inc. for the U.S. Environmental Protection Agency in order to collect samples of surface dust for measurement of the concentration of lead, pesticides, and other toxins in the dust. The HVS-3 weighs less than 30 pounds and is easy to use, clean, and ship. It can be conveniently carried by one person and fits in the trunk of a car. The HVS-3 is made from aluminum and can be easily cleaned to the exacting QA/QC standards of pesticide, PCBs, and semi-volatile organics testing.

The HVS-3 is capable of collecting a large, representative sample of dust from indoor surfaces such as rugs and bare floors, and dust from outdoor surfaces such as streets, sidewalks, and lawns. A sample can be collected in 10 minutes that is sufficiently large for multiple chemical analyses and bioassays. The HVS-3 has been used to assess risks from lead, pesticides, and other contaminants in house dust.

The HVS-3 maintains uniform sampling conditions by measuring and controlling the air flow and the pressure drop across a 5-inch nozzle. A 3-inch cyclone collects more than 99% of the average house dust. The cyclone catch cup can be used to transport the sample, and a backup filter can be used behind the cyclone if desired.

ASTM has developed a standard practice for collecting surface dust samples for chemical analysis using the HVS-3. This standard practice assists in ensuring the collection of high integrity samples.

The sampling methodology used to collect the indoor dust samples from the residences was based on [1] 3TM International's "Guidelines for the Collection of Indoor and Outdoor Dust Samples Potentially Contaminated with PCBs, Volatile Hydrocarbons, Semi-Volatile Hydrocarbons, and Metals" and [2] the ASTM standard practice for collecting dust samples using the HVS-3 unit. These documents describe the health and safety, sample collection and handling, decontamination, and documentation aspects of the sample collection program.

Sample Collection Logs, including Survey Questionnaires for the samples collected

are presented in Appendix C. Floor plans of the residences sampled are shown in Appendix D. Photographs of the residences sampled are presented in Appendix E.

3.2 Collection of Indoor Dust Samples

Indoor dust samples were collected during the August 27 - 31, 2001 field campaign which included 9 residences surrounding the Kuhlman Facility in Crystal Springs, Mississippi (hereinafter referred to as the "Dust Group"):

- ▶ Site #1
302 McPherson Street
Crystal Springs, Mississippi
- ▶ Site #2
108 Tucker Street
Crystal Springs, Mississippi
- ▶ Site #3
111 McPherson Street
Crystal Springs, Mississippi
- ▶ Site #4
100 Pearl Street
Crystal Springs, Mississippi
- ▶ Site #5
103 Tucker Street
Crystal Springs, Mississippi
- ▶ Site #6
407 Jackson Street
Crystal Springs, Mississippi
- ▶ Site #7
412 Lee Street
Crystal Springs, Mississippi

104 Forrest Street
Crystal Springs, Mississippi
- ▶ Site #9
403 Jackson Street
Crystal Springs, Mississippi

Soil and indoor dust samples were collected at 302 McPherson Street. The methodology behind sample collection at this location are explained in Section 2.1.

The indoor dust sample collected at 108 Tucker Street was collected based on previous environmental media testing. This location has previously exhibited high levels of PCBs in the soil, indoor dust, and the blood of its residents. Two residents at this location exhibit elevated PCB levels in their blood (Bettie Kendrick & Dannie S. Barnes). Mrs Kendrick exhibited 7.3 ppb, while Mr. Barnes exhibited a PCB level of 3.3 ppb in his blood. Previous indoor dust sampling indicated the presence of 41 ppb PCB, while all soil samples collected by 3TM International revealed significant levels of PCB. Soil results ranged from 1.48 to 16.9 ppm. Testing conducted by representatives of Kuhlman indicated PCB results as high 51 ppm.

The indoor dust sample collected at 111 McPherson Street was collected due to previous environmental media testing. This location has exhibited high levels of PCBs in the soil and the blood of its resident (Beulah Sojourner). Mrs. Sojourner exhibited a PCB level of 10.5 ppb in her blood. Previous soil testing conducted by 3TM International indicated PCBs present ranging from BRL to 0.238 ppm. Samples collected by Kuhlman indicated PCBs as high as 2.6 ppm.

The indoor dust sample collected at 100 Pearl Street was collected due to previous environmental media testing. This residence has exhibited high levels of PCB in the soil, indoor dust, and the blood of its resident (Wanda Ward). Mrs. Ward exhibited a PCB Level of 3.2 ppb in her blood. Prior indoor dust sampling indicated the presence of 0.150 ppm PCB, while soil testing indicated PCBs ranging from BRL to 0.30 ppm.

The indoor dust sample collected at 103 Tucker Street was collected due to previous soil testing and elevated PCB levels in its resident's blood (Daniel Graham). Mr. Graham exhibited a PCB level of 22.0 ppb in his blood. Previous soil testing indicated the presence of PCBs ranging from BRL to 0.0519 ppm, while prior indoor dust sampling was below reporting limits.

The indoor dust sample collected at 407 Jackson Street was collected due to the previous testing of various environmental media indicating the presence of high levels of PCBs. This residence has indicated high levels of PCBs in both the soil and indoor dust. Prior indoor dust sampling indicated the presence of PCBs ranging from 0.220 ppm to 0.616 ppm. Soil testing indicated PCBs ranging from BRL to 0.178 ppm.

The indoor dust sample collected at 412 Lee Street was collected due to its proximity to the Kuhlman Facility and to high levels of PCBs found in the soil. All soil samples collected by 3TM International at this location indicated the presence of PCBs. The soil testing results ranged from 0.271 ppm to 5.44 ppm. Kuhlman testing indicated PCB results as high as 5.5 ppm. Prior indoor dust sampling was below reporting limits.

The indoor dust sample collected at 104 Forrest Street was collected due to the widespread presence of high levels of PCBs. This residence has previously been tested for PCBs in its soil, indoor dust, and residents blood (Ralph Williams). Mr.

Williams exhibited a PCB level of 13.9 ppb in his blood. All 3TM International soil testing indicated results of PCBs. The soil results ranged from 1.71 ppm to 108 ppm. Kuhlman soil sampling indicated results for PCBs as high as 70 ppm. This location also indicated the presence of high levels of Dioxin. Two samples from this address were analyzed for Dioxin. Sample HA-30 indicated a Toxicity Equivalency Quotient (TEQ) of 189, while HA-32 indicated a TEQ of 28.9.

Soil and indoor dust samples were collected at 403 Jackson Street. The reasons for sample collection at this location are explained in Section 2.1.

3.3 Methodology for the Analytical Testing of Indoor Dust Samples

The analytical testing methodology used to test the contents of the indoor dust samples is summarized in Appendix G. Laboratory testing was provided by Midwest Research Institute of Kansas City, Missouri. All samples were tested for polychlorinated biphenyls (PCBs) using EPA Method 680. The results of the analytical testing are summarized in Table 2. The complete MRI analytical testing reports are also presented in Appendix G.

4.0 Findings and Recommendations

4.1 Results of the Soil Sampling Program

The primary constituents of concern at the Crystal Springs site are Polychlorinated Biphenyls (PCBs); therefore, all samples were tested for these analytes. Although Dioxins have been also detected at several sampling locations, analytical testing for Dioxins was not conducted for this field campaign.

The soil testing results indicated the following:

- PCBs (PCB-1260) were detected in the soil at 8 of the 9 residences.
- Concentrations of PCBs greater than 1 mg/kg (ppm) were detected at 106 Puckett Street and 403 Jackson Street. 1 ppm represents the MDEQ action level for remediation of soils.
- No samples at 302 McPherson Street indicated PCBs.
- Two of the 16 samples tested at 308 McPherson Street indicated PCBs. The highest concentration reported was 0.052 mg/kg.
- Both of the samples tested at 300 A McPherson Street indicated PCBs. The highest concentration reported was 0.275 mg/kg.
- Thirteen of the 20 samples tested at 106 Puckett Street indicated PCBs. The highest concentration reported was 1.83 mg/kg.
- Four of the twenty samples tested at 104 Puckett Street indicated PCBs. The highest concentration reported was 0.0495 mg/kg.
- One of the 20 samples tested at 105 Tucker Street indicated PCBs. The concentration reported was 0.0198.
- Thirteen of 19 samples tested at 200 Moore Street indicated PCBs. The highest concentration reported was 0.331.
- One of the 20 samples collected at 106 Moore Street indicated PCBs. The concentration reported was 0.113.
- Three of the 10 samples tested at 403 Jackson Street indicated PCBs. The highest concentration reported was 1.46 mg/kg.

The indoor dust testing results indicated the following:

- Total PCBs were detected in 8 of the 9 indoor dust samples.
- Concentrations of total PCBs greater than 1 mg/kg were detected at 407 Jackson Street and 104 Forrest Street.

- The indoor dust sample at 407 Jackson Street indicated 1.12 mg/kg total PCBs.
- The indoor dust sample at 104 Forrest Street indicated 4.22 mg/kg total PCBs.

The results of all analytical testing are summarized in Table 1 and Table 2. The complete analytical testing reports are presented in Appendix F and Appendix G. A basic statistical overview of the August, 2001 soil sampling results is shown in Table 3.

4.2 Significance of Findings

The findings should be considered in light of the following:

- The soil sampling program was limited in scope, both in terms of the number of residences sampled, and the number of samples collected and tested from each residence.
- The indoor dust sampling program was limited in scope, both in terms of the number of residences sampled, and the number of samples collected and tested from each residence.
- The presence of dust and the duration of dust accumulation can vary from residence to residence. Dust can accumulate in many places. The length of time in which dust has been present cannot be determined, based on the results of the work performed to date. The dust collected could have accumulated over a number of years, or even in the recent months.
- Therefore, the results presented herein do not necessarily represent the maximum extent of PCB contamination that could potentially exist at the residences, or the maximum concentrations of PCBs that could exist at any given residence.

4.3 Recommendations

Based on the analytical testing results of the August 2001 field program, we recommend:

- Correlation of the soil and indoor dust sampling data with previous analytical testing results from soil and sediment sampling data, indoor dust sampling data, human blood sampling data, and other information.
- Formulating a plan of further action based on the results of the above correlations and evaluations.

SOIL SAMPLING LOG

3TM INTERNATIONAL
Houston, Texas

Project Name: Crystal Springs

Site Name: Crystal Springs, MS

Location: 302 McPherson St.

Boring Number: HA-43A

Date Sampled: 8/27/01

Time Sampled: 0827

Sampling Method: Hand Auger

Sample Depth: 6 inches bgs

Type of Soil: sandy Silt

Sample Matrix: Soil

Sample Analysis: PCB 8082

Sample Container: 1 - 4 oz. GC

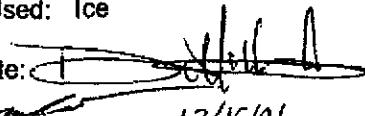

Sample Quantity Collected: 4 oz.

Preservative Used: Ice

Environmental Supervisor: David McCloskey

AUTHORIZATION AND STATEMENT OF HOMEOWNER

On the date indicated below, I, Odell Smith, allowed field technicians from 3TM International, Inc. to collect indoor dust from my home at the address shown above for the purpose of laboratory analysis to determine whether PCBs and/or other environmental contamination is present. I affix my signature below to indicate my consent to indoor dust collection and analysis.

DATE

On the day indicated below, I, Odell Smith, allowed field technicians from 3TM International, Inc. to remove the disposable dust bag from my working vacuum cleaner, have initialed and dated it with a permanent marker, and have allowed it to be taken by the field technician. I affix my signature below to indicate that I have done as I have indicated. If my vacuum cleaner did not have a disposable bag, I allowed it to be emptied outside of my house, witnessed this procedure, and I initialed and dated the bag into which the contents were collected.

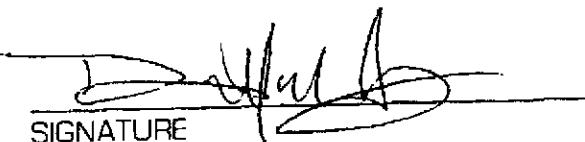

Odell Smith

DATE

STATEMENT BY 3TM INTERNATIONAL FIELD TECHNICIAN

DUST SAMPLE

I, DAVID McCLOSKEY, a field technician with 3TM International, have received the initialed vacuum bag from the above named person, have inspected the initials and date marked on the bag, and have numbered the sample by marking on the bag with a permanent marker. I then placed the vacuum cleaner bag in a suitable plastic bag labeled with the sample number, source, my initials, and date. For persons who did not have disposable vacuum bags, I removed the bag from the vacuum cleaner outside of the home while wearing impervious gloves and a dust mask, and emptied the vacuum cleaner bag into a plastic bag which I have provided for this use, and have had the person contributing the bag witness this procedure and initial and date the bag; I have done the same. In addition, I have marked the sample number on the plastic bag into which I emptied the contents of the non-disposable vacuum bag.

FIELD NOTES

- 13:30 Moved to III McPherson, to collect indoor dust.
Met resident.
- 13:37 Set up equipment - deconned before moving vacuum inside.
- 13:52 Set up @ sample area ①. Area is on top of TV 16" x 28" and sampled for 2 min and 17 seconds.
- 14:11 Moved into dining room, sample Freezer top ~~area~~
14:19 Sampled of top of Wall Locker in dining room
- 14:21 Moved to front middle bedroom, sampled top of suit case under bed.
- 14:23 Moved to storage room, sampled Buffet top (corner)
- 14:27 Moved to living room, sampled desk shelf (top).
- 14:33 Master Bedroom, Top of t.v.
- 14:41 Corner of dresser in Master bedroom.
- 15:12 Climbed into attic, belly crawl, for next location.
- 15:22 1/2 sample bottle collected. wrap up & move equipment outside.
- 15:32 Deconned equipment, moving to 100 Pearl St.

AUTHORIZATION AND STATEMENT OF HOMEOWNER

On the date indicated below, I, BELLAH SOJOURNER, allowed field technicians from 3TM International, Inc. to collect indoor dust from my home at the address shown above for the purpose of laboratory analysis to determine whether PCBs and/or other environmental contamination is present. I affix my signature below to indicate my consent to indoor dust collection and analysis.

DATE

STATEMENT BY 3TM INTERNATIONAL FIELD TECHNICIAN *IN DOOR DUST*

I, DAVID MCCLOSKEY, a field technician with 3TM International, have received the initialed vacuum ~~bag~~ from the above named person, have inspected the initials and date marked on the bag, and have numbered the sample by marking on the bag with a permanent marker. I then placed the vacuum cleaner bag in a suitable plastic bag labeled with the sample number, source, my initials, and date. For persons who did not have disposable vacuum bags, I removed the bag from the vacuum cleaner outside of the home while wearing impervious gloves and a dust mask, and emptied the vacuum cleaner bag into a plastic bag which I have provided for this use, and have had the person contributing the bag witness this procedure and initial and date the bag; I have done the same. In addition, I have marked the sample number on the plastic bag into which I emptied the contents of the non-disposable vacuum bag.

STATEMENT BY 3TM INTERNATIONAL FIELD TECHNICIAN

Dust Sample

I, David (f/k/a David), a field technician with 3TM International, have received the initialed vacuum bag from the above named person, have inspected the initials and date marked on the bag, and have numbered the sample by marking on the bag with a permanent marker. I then placed the vacuum cleaner bag in a suitable plastic bag labeled with the sample number, source, my initials, and date. For persons who did not have disposable vacuum bags, I removed the bag from the vacuum cleaner outside of the home while wearing impervious gloves and a dust mask, and emptied the vacuum cleaner bag into a plastic bag which I have provided for this use, and have had the person contributing the bag witness this procedure and initial and date the bag; I have done the same. In addition, I have marked the sample number on the plastic bag into which I emptied the contents of the non-disposable vacuum bag.

Houston , TX 77077

Reference: XENCO Report No: 213578
Project Name : Crystal Springs PCB
Project Address: Crystal Springs, MS

Randy Horsak :

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Chain of Custody Numbered 213578 . All results being reported under this Chain of Custody apply to the samples analyzed and properly identified with a Laboratory ID number.

All the results for the quality control samples were reviewed. Also, all parameters for data reduction and validation were reviewed. In view of this, we are able to release the analytical data for this report within acceptance criteria for accuracy, precision, completeness or properly flagged.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in COC No. 213578 will be filed for 60 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

A handwritten signature in black ink, appearing to read "Eddie L. Clemons, II".

Subject: MRI Project No. 310226.1.001, "Analysis of Total PCBs in Dust Samples"

Dear Mr. Horsak:

Midwest Research Institute (MRI) has completed the analysis of the dust samples submitted by your organization. The samples were analyzed for total polychlorinated biphenyls (PCBs) by MRI procedures based upon Method 680 "Determination of Pesticides and PCBs in Water and Soil/Sediment by Gas Chromatography/Mass Spectrometry (November 1985). The objective of the study was to characterize the dust samples for total PCB homolog concentrations. This report briefly describes the methods used to prepare and analyze the samples and presents the results of the PCBs from analysis of the provided samples.

Sample Preparation

Sample receipt documentation is presented in Attachment 1. Method 680 was modified to replace the surrogate compounds used in preparation and the internal standard used in analysis. The compounds referenced in Method 680 are isotopically labeled semivolatile compounds that MRI replaced with labeled PCB compounds.

A percent moisture determination was performed on samples with sufficient mass. Three samples (CMS-VC-021, CMS-VC-024, and CMS-VC-028) did not have sufficient mass to perform this test. The percent moisture determination was performed by mixing thoroughly, weighing a 5 g subsample into a vial and then drying in an oven at 110°C overnight. The percent moisture data is presented on Table 1 but the data results are reported on an as-received or wet-weight basis.

Samples were mixed and aliquoted. The ideal weight for extraction is 5±1 g of dust. Samples were mixed with sodium sulfate and were fortified with a surrogate solution containing three ¹³C-isotopically labeled PCBs and allowed to equilibrate for 1 hr. The samples were soxhlet extracted with a 50:50 (v/v) mixture of hexane:acetone for 18 hr following MRI standard operating procedure (SOP) MRI-5204, Revision 0.

P 001691

Extracts were passed through a funnel containing sodium sulfate and were concentrated by Kuderna Danish (KD) to 10-mL of hexane. The extracts were partitioned against a 5% sodium chloride solution and then concentrated sulfuric acid in separatory funnels following SOP MRI-5201, Revision 2. The purpose of this cleanup was to remove co-extracted interferences that would affect GC/MS analysis. Two samples (CMS-VC-027 and CMS-VC-028) were still highly colored following this step. In order to remove this potential interference, these two samples plus the method blank were subjected to an acidified silica slurry technique following SOP MRI-5201, Revision 2. The hexane extracts for all samples were then passed through another funnel containing sodium sulfate and were concentrated by Kuderna Danish (KD) and nitrogen evaporation (N-Evap) to a final volume of 5-mL in hexane.

A 1-mL portion of each extracts was then fortified with an internal standard containing d_6 -Tetra PCB (BZ 77) and supplied for analysis by gas chromatography with detection by low resolution mass spectrometry (GC/LRMS) in the selected ion monitoring mode.

LRMS Analysis

Analysis for PCBs was performed on a Fisons 8030 GC and Finnigan MD-800 quadrupole MS system equipped with a Carlo Erba A200S autosampler. The GC used a 30-m DB-5 column. Analyte detection was performed in the selected ion monitoring (SIM) mode following modified Method 680. The modifications to the analysis portion of Method 680 included monitoring the mass ions for the surrogates ^{13}C -tetrachlorobiphenyl (BZ 77), ^{13}C -octachlorobiphenyl (BZ 194), and ^{13}C -decachlorobiphenyl (BZ 209), and the internal standard d_6 -Tetra PCB (BZ 77).

Retention time windows were established prior to calibration by analysis of a window defining mix containing the first and last eluting PCBs for each homolog group on the DB-5 column. For example, 2-monochlorobiphenyl and 4-monochlorobiphenyl were used to establish retention time windows for all monochlorobiphenyls.

The GC/MS was calibrated using five standards as specified in Method 680. The system met initial and continuing calibration criteria. The relative standard deviation of the response factors determine for the individual PCBs in the five standards was less than 20%. Continuing calibration was performed before and after each 12-hr analysis period. Response factors for the continuing calibration standards were within 20% difference of the average response factors for the curve.

Data Reduction

Each PCB homolog group was monitored by at least three ion masses over the retention time windows of the first and last known eluting congeners. In order for a peak to be qualitatively identified as a PCB; (a) it had to elute within the isomer retention time window, (b) the ratio of the primary and secondary ion areas for each peak had to fall within an established ratio as described in Method 680, (c) the apexes of the two ions had to maximize within 1 sec and (d) a tertiary ion (reflective of chlorine loss) had to be present.

If peaks passed these criteria, the quantitation ion area was summed and used in quantifying the total area present for the homolog group. The response factors from the calibration curve, the initial weight, and final volume were used to calculate results by the internal standard technique.

Quality Control

The following quality control samples are prepared with each batch of samples.

- Method Blank: 5-g of pre-extracted quartz sand, fortified with ¹³C-labeled surrogates. The blank is used to demonstrate the lack of contamination during laboratory operations. The method blank is processed through all steps in the procedure along with the samples.
- Lab Control Sample (LCS) and LCS duplicate: Same as the method blank but also fortified with Aroclor 1260 at known levels. Aroclor 1260 was chosen because information indicated that it was once present on-site. The LCS is used to demonstrate accuracy and precision of the analysis. The LCS is processed through all steps in the procedure along with the samples.

Results and Discussion

Results for the samples and quality control samples are presented in Table 1. Results are reported in units of nanograms per gram (ng/g) or parts per billion (ppb) on an as-received basis. Results are reported as not detected (ND) if there were no individual peaks observed above a reporting limit based upon the concentration of the lowest level calibration standard adjusted for a nominal 5-g sample weight. The method blank did not show contamination above the low level standard used in analysis.

Recoveries of the surrogate compounds are presented in Table 2. The surrogate recoveries in all samples with the exception of ¹³C-decachlorobiphenyl in sample CMS-VC-020 were within the range of 40 to 140 percent recovery (Note Method 680 does not specify recovery acceptance limits). The single results outside of the recovery range is flagged "J" on Table 2. The recovery in CMS-VC-020 is just below the lower limit and is not considered to affect the reported results for this sample.

The LCS/LCSD accuracy and precision data are presented in Table 3. Because Aroclor 1260 is a mixture of PCBs and congeners less than the lowest calibration standard are not quantified, there is potential for underestimating the total PCB content. The accuracy and precision from the analysis is, however, considered acceptable.

Ion plots for all samples and QC samples are presented in Attachment 2 as requested. Based on existing literature (Erickson, 1992 and deVoogt et. al., 1990), penta-, hexa-, and hepta-substituted PCBs are the major PCB congeners present in Aroclor 1260. This is confirmed in the analysis of the Aroclor 1260 LCS/LCSD samples. Therefore, the ion plots for the LCS/LCSD can be used to compare to the sample results to establish a

potential correlation with Aroclor 1260. Based on this review, all samples and the LCS/LCSD showed similar patterns in the hexachlorobiphenyl window with the exception of CMS-VC-024 (ND for all), CMS-VC-027, and CMS-VC-028 indicating that Aroclor 1260 is a likely contaminant in these samples.

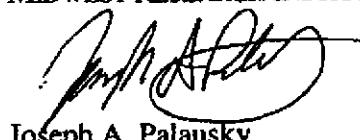

Although both CMS-VC-027 and CMS-VC-028 show the same pattern in the hexachlorobiphenyl window indicating the likely presence of Aroclor 1260, they also show the presence of tri- and tetra-substituted PCBs. These additional PCBs may be present due to weathering or to co-contamination with other PCBs. Based on the literature cited above, tri- and tetra-substituted PCBs are the major PCB congeners present in Aroclor 1242. Therefore it is possible that both samples represent mixtures of Aroclor 1242 and Aroclor 1260 with the majority of the PCB concentration attributable to Aroclor 1260.

Method 680 is used to establish total PCBs by level of chlorination and is not typically used for the determination or confirmation of Aroclor mixtures. The determination of PCBs as Aroclors is performed by SW-846 Method 8082. As individual Aroclor standards were not analyzed (not required by Method 680) with this sample set, the identification of the PCBs present as Aroclor mixtures described above is not definitive. This evaluation can be performed by additional analysis of standards by GC/LRMS or analysis of samples by SW-846 Method 8082 if requested.

We appreciate the opportunity to assist you with your analysis needs. If you have any questions regarding the data presented, please do not hesitate to contact me at (816)-753-7600, Extension 1626 or via e-mail at jpalausky@mriresearch.org.

Sincerely,

MIDWEST RESEARCH INSTITUTE
