## **1.0 INTRODUCTION**

### **1.1 Background**

Kuhlman Electric Corporation (KEC) owns and operates a transformer manufacturing plant in Crystal Springs, Mississippi (Figure 1). The KEC plant was constructed in the 1950s and has been owned and operated as a transformer manufacturing plant since that time. On April 19, 2000, BorgWarner received notification from KEC, in accordance with a prior purchase agreement, that areas of contaminated soil had been found at the plant site.

Environmental assessments conducted at the KEC plant site indicated the presence of soil contaminated with polychlorinated biphenyls (PCBs) and various chlorinated benzenes. BorgWarner, on behalf of KEC, engaged an environmental consultant to prepare a groundwater assessment work plan. The groundwater assessment plan was prepared in response to Mississippi Commission on Environmental Quality Order No. 4449-02, issued to KEC on July 23, 2002.

The preliminary groundwater assessment was conducted in March and April 2004 to determine if chemical constituents previously detected in site soils impacted groundwater beneath the plant site. During the preliminary groundwater assessment, eight permanent monitoring wells were installed on the KEC property in areas that contained the highest concentrations of PCBs as identified during the plant site soil assessment. During the installation of the monitoring wells, soil, perched groundwater, and groundwater from the uppermost aquifer were sampled and analyzed for the presence of PCBs, volatile organic compounds (VOCs) and semi-volatile compounds (SVOCs). Chlorinated and non-chlorinated organic compounds were detected in groundwater samples collected during the preliminary groundwater assessment. A *Preliminary Groundwater Assessment Report* was prepared and submitted to the Mississippi Department of Environmental Quality (MDEQ) in July 2004.

After MDEQ's review of the preliminary groundwater assessment, a *Comprehensive Groundwater Assessment Work Plan* was prepared and submitted to MDEQ for review and approval. In a letter dated September 22, 2006, MDEQ approved the Work Plan.

A *Groundwater Interim Progress Report* was prepared and submitted to MDEQ in September 2007, providing MDEQ with an update of the sampling and analysis of groundwater from the Crystal Springs municipal water supply wells and municipal supply line. The report also detailed the installation of 28 additional monitoring wells on the KEC property and vicinity, which resulted in a monitoring well network of 36 wells (i.e., eight existing wells and the 28 newly installed wells). The report presented analytical results from the July and August 2007 sampling events that involved the collection of groundwater samples from 36 monitoring wells located on and off the plant property.

A *Groundwater Interim Progress Report II* was prepared and submitted to MDEQ in February 2008. This report provided MDEQ with an update of the November 2007 sampling event that involved the collection and analysis of groundwater samples from 36 monitoring wells located on and off the plant property. This report also summarized the analytical results of the municipal wells and municipal supply line monthly sampling events from July through December 2007.

A *Groundwater Interim Progress Report III* was prepared and submitted to MDEQ in August 2008. The report summarized groundwater sampling and analysis activities associated with the March and June 2008 sampling events involving the 36 monitoring wells located on and off the plant property. This report also summarized the analytical results of the municipal wells and municipal supply line monthly sampling events from January through June 2008.

A *Groundwater Interim Progress Report IV* was prepared and submitted to MDEQ in November 2008. The report summarized groundwater sampling and analysis activities

associated with the September 2008 sampling event involving the 36 monitoring wells located on and off the plant property. This report also summarized the analytical results of the municipal wells and municipal supply line monthly sampling events from July through September 2008.

## **1.2 Site Description**

The KEC plant is located at 101 Kuhlman Drive, Crystal Springs, Copiah County, Mississippi (latitude N 31° 15' 20" and longitude W 90° 21' 20"). The plant site is located within the Crystal Springs town limits. The town center is located approximately 0.25 miles south of the plant (Figure 1). Commercial businesses and residences are located along Lee Street, which borders the KEC property to the south. A railroad corridor and residences lie to the west of the plant. A vacant lot, formerly occupied by an icehouse, is located across Fulgham Avenue to the north of the plant, and private residences are located to the northeast. East of the plant and abutting the property are residences and one former funeral home. The residences are all single-family dwellings with individual yards. The single-family dwellings extend for several blocks in all directions except north. A church and a public swimming pool are located within two blocks of the site to the east. The predominant land-uses in the surrounding area are commercial, former industrial, institutional, and residential.

The KEC property consists of a manufacturing plant building situated on about 15 acres of land. This site has been used for industrial manufacturing purposes since the mid-1950s. The future use of the property is anticipated to remain industrial.

## **1.3 Scope of Report**

This Groundwater Interim Progress Report V provides an update to MDEQ for the following work:

1. Monthly sampling and analysis of the City of Crystal Springs municipal water supply wells and municipal supply line from October 2008 through December 2008;
2. Sampling and analysis of groundwater samples collected during the month of December 2008 from the 36 monitoring wells located on and off the plant property.

## **2.0 MUNICIPAL WELL MONITORING**

For a summary of the background and previous sampling activities and procedures associated with the City of Crystal Springs municipal wells and municipal supply line, please refer to the *Groundwater Interim Progress Report*, dated September 2007, the *Groundwater Interim Progress Report II* dated February 2008, the *Groundwater Interim Progress Report III* dated August 2008, and the *Groundwater Interim Progress Report IV* dated November 2008. The municipal well locations are depicted in Figure 2 of this report.

From September 2004 through December 2006, the operating municipal supply wells located south of the KEC plant and the municipal supply line were sampled on seven occasions. From January 2007 through December 2008, the municipal wells and municipal supply line were sampled and analyzed by the on-site laboratory on a monthly basis. At least 10% of the groundwater samples collected from the municipal wells were split and sent to the off-site laboratory for confirmation of the on-site laboratory results. Analytical results of the samples analyzed by both laboratories are summarized in Tables 1 and 2.

Sample analyses by both the on-site and off-site laboratories have identified concentrations of 1,1-dichloroethene (1,1-DCE) and 1,4-dioxane above the method reporting limit in the sample collected from municipal well CSW-WA1. The detected concentrations of 1,1-DCE and 1,4-dioxane are well below their respective MDEQ Target Remediation Goals (TRGs).

### **3.0 MONITORING WELLS**

Monitoring well construction details and historical and current water column (head) elevations are provided in Table 3. A complete description of well installation activities is presented in the *Groundwater Interim Progress Report* dated September 2007.

For this interim assessment period, the network of 36 on-site and off-site monitoring wells was sampled December 1-8, 2008. All groundwater samples collected from the monitoring wells were analyzed by the on-site laboratory, Environmental Chemistry Consulting Services, Inc., Madison, Wisconsin (ECCS) for volatile organic compounds (VOCs) and 1,4-dioxane. At least 10% of the samples were split and shipped to the off-site laboratory, Columbia Analytical Services, Inc. (CAS) of Kelso, Washington for confirmation of the on-site laboratory results.

An analytical summary of VOCs and 1,4-dioxane concentrations detected in samples collected from the on-site monitoring wells is presented in Table 4 (on-site laboratory results) and Table 4A (off-site laboratory results). An analytical summary of VOCs and 1,4-dioxane concentrations detected in samples collected from the off-site monitoring wells is presented in Table 5 (on-site laboratory results) and Table 5A (off-site laboratory results). Figure 3 depicts the monitoring well locations and the 1,1-DCE isoconcentrations for the December 2008 sampling event. Figure 4 depicts the monitoring well locations and the 1,4-dioxane isoconcentrations for the December 2008 sampling event.

The groundwater sampling procedures used during each sampling event conform to current United States Environmental Protection Agency (USEPA) Region 4 standard procedures (SESDPROC-301-R1, Groundwater Sampling, November 1, 2007). As previously approved by MDEQ, all monitoring wells were purged using low-flow sampling techniques prior to sample collection. During purging, water level and water quality field parameter measurements were collected for each monitoring well until the

measurements indicate that formation water has been drawn into the well. Water levels also were monitored to confirm minimum drawdown during purging. At the conclusion of the purging process, the low-flow sampling technique was employed to collect groundwater samples from each well during all sampling events.

Groundwater samples were collected in 40-ml glass vials with septum caps and 1 liter amber jars with no preservative. Samples were immediately placed on ice in a cooler at 4° C and carried to the on-site laboratory under proper chain-of-custody protocols. The samples were analyzed by the on-site laboratory for VOCs and 1,4-dioxane by EPA Method 8260B.

At least 10% of groundwater samples collected were split and sent to the off-site laboratory for confirmation of the on-site laboratory results. All laboratory split and duplicate samples sent to the off-site laboratory for VOC analysis were preserved with hydrochloric acid.

#### **4.0 QUALITY CONTROL SUMMARY REPORT**

The on-site laboratory and off-site laboratory data for the municipal water supply wells, municipal supply line, and on-site and off-site monitoring wells have been reviewed to ensure that the data are of sufficient quantity and quality to support the data quality objectives previously established in the *Comprehensive Groundwater Assessment Plan, October 2004*.

As established by the MDEQ guidelines, all work related to the groundwater assessment has been performed in accordance with current USEPA Region 4 standard procedures.

The samples were analyzed for VOCs by the on-site laboratory, ECCS of Madison, Wisconsin, using EPA Method 8260B. The procedure incorporates all the quality control rigors of the full 8260B method, including quantification based on six-point calibration with continuing calibration verification, surrogate method performance monitoring, method blanks, and matrix spike/matrix spike duplicate (MS/MSD) samples. The reporting limit established for water analysis by the on-site laboratory is 1.0 µg/L. This reporting limit is below the established TRGs for target analytes with the exception of trans-1,3-dichloropropene and chloroform.

In September 2006, 1,4-dioxane was added to the analyte list. ECCS filters the sample and surrogate solution through an activated carbon disk, then extracts the sample with methanol and analyzes it by direct injection Mass Spectrometry – Selective Ion Monitoring (MSD/SIM).

At least 10% of the samples were split and sent off-site to CAS in Kelso, Washington for analysis of the same parameters as the on-site laboratory to verify the on-site laboratory's results. The off-site laboratory analyzed the samples using EPA method 8260B for VOCs. The off-site laboratory extracted base/neutral analytes by method 3510 and analyzed the extract by Method 8270C using SIM for the analysis of 1,4-dioxane.

The criteria upon which the data have been reviewed include:

- Holding Times
- Method Blanks
- Laboratory Control Samples
- Matrix Spike/Matrix Spike Duplicates
- Surrogate Recoveries
- Blind Duplicate Analysis
- Blanks
- Split Sample Analysis

#### **4.1    Laboratory Data Review**

The laboratory reports were reviewed for reporting accuracy and consistency with laboratory Quality Assurance/Quality Control (QA/QC) protocols. Confirmation of the on-site laboratory results was accomplished through the comparison of the on-site laboratory data with the data from the off-site laboratory.

##### **4.1.1 Holding Times**

Water samples designated for VOC analysis by the on-site laboratory were collected in 40-ml vials without preservative. The samples were placed on ice at the time of collection and were analyzed by the on-site laboratory within seven days of collection. Samples collected and shipped to the off-site laboratory were collected in 40-ml vials containing hydrochloric acid. The samples were placed on ice at the time of collection, shipped on ice, and maintained in the laboratory at  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . The maximum holding time for preserved samples is 14 days from sample collection to sample analysis. All water samples collected for VOC analysis were reported by the on-site laboratory to have been analyzed within the appropriate holding time.

Water samples designated for 1,4-dioxane analysis were collected in laboratory provided 1-liter amber jars containing no preservatives for the on-site laboratory and 250 ml amber jars containing no preservatives for the off-site laboratory. The samples were placed on ice at the time of collection and maintained in the laboratory at  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ . Samples sent to the off-site

laboratory were shipped on ice. The maximum holding time is 7 days from sample collection to sample extraction and 40 days from sample extraction to sample analysis. All water samples collected for 1,4-dioxane analysis were reported by the laboratories to have been extracted and analyzed within the appropriate holding time.

#### 4.1.2 Method Blanks

Method blanks were analyzed by each laboratory for each requested analytical method. Method blanks were processed and analyzed at a frequency of one per day or one per 20 samples, whichever was greater. Method blank results for both laboratories were reviewed to evaluate the presence of target and non-target compounds in the blanks. Both laboratories reported acceptable method blank performance.

#### 4.1.3 Laboratory Control Samples

Laboratory control samples (LCS) were analyzed by the off-site laboratory for each method at a minimum frequency of one per 20 samples. The off-site laboratory's LCS sample results were reviewed to evaluate the performance of the entire analytical system including preparation and analysis. The off-site laboratory's performance with regard to the LCS sample analysis and reported flags are acceptable.

#### 4.1.4 Matrix Spike/ Matrix Spike Duplicates

Matrix spikes (MS) and matrix spike duplicates (MSD) were performed by both laboratories at a minimum frequency of one MS and MSD per 20 samples. The laboratories performed well with regards to the MS/MSD performance criteria, and spike recoveries were reported to be within the control limits.

#### 4.1.5 Surrogate Recoveries

Both laboratories performed well with regards to surrogate recoveries. No surrogate recoveries were reported outside the applicable control limits by the off-site laboratory, and no laboratory performance issues were identified.

#### 4.1.6 Duplicate Analysis

Blind duplicate samples were submitted to the laboratories without indication of the associated sample. The relative percent difference (RPD) between each sample and its duplicate for analytes detected in any duplicate pair were calculated based on the following equation:

$$\text{RPD (\%)} = \text{Absolute value of } ((C_S - C_D)/(C_S + C_D)/2) \times 100$$

Where:  $C_S$  = Concentration of the sample

$C_D$  = Concentration of the duplicate sample

Both laboratories reported excellent performance with regard to the reproducibility of the data.

#### 4.1.7 Blanks

Trip blanks were submitted to the off-site laboratory for analysis of VOCs. Field blanks and rinsate samples were submitted to the on-site laboratory for analysis of VOCs and 1,4-dioxane. No target analytes were detected in these samples.

#### 4.1.8 Split Sample Analysis

At least 10% of the samples were split and sent to CAS for confirmation. The samples were analyzed by the same or comparable analytical methods for VOCs. A comparison of the analytical results for VOCs indicates that the on-site laboratory is consistently meeting the data quality objectives.

Where both laboratories reported no detections above the reporting limit, even where the reporting limits were different, the duplicate pair was considered to be within acceptable control limits. The split sample analytical results for 1,1-DCE showed excellent comparability between the two laboratories with no RPDs outside the control limit. The split sample analytical results for 1,4-dioxane showed excellent comparability with no RPDs outside the control limit.

## **4.2 Data Usability**

### 4.2.1 Precision – Relative Percent Difference

Each laboratory's reported measurements of precision are acceptable.

### 4.2.2 Accuracy – Percent Recovery

Discussions of the accuracy of the MS/MSD and LCS are provided in previous sections of this report. VOC surrogate recoveries were reported to be within control limits for VOC analyses, including the QC data.

### 4.2.3 Field QA/QC

Field personnel adhered to all procedures outlined in Section 4 of the *Comprehensive Groundwater Assessment Plan, October 2004*.

### 4.2.4 Analytical Methods

Reported analytical methods were consistent with those specified in the sampling and analysis plan and appropriate for the associated sample matrices.

## **4.3 Completeness**

The data are complete and satisfy the data quality objectives for this project. As detailed above, the type and frequency of applicable QC samples were reported to be in accordance with the *Comprehensive Groundwater Assessment Plan, October 2004* and other applicable guidance documents. Field QC samples were collected in accordance with the specified criteria.

#### **4.4 Comparability**

Standard sampling and handling protocols were successfully implemented for all samples and sample matrices. Field and laboratory records were maintained. Standard and appropriate analytical methods were used to analyze all samples. Analytical results were reported in appropriate units.

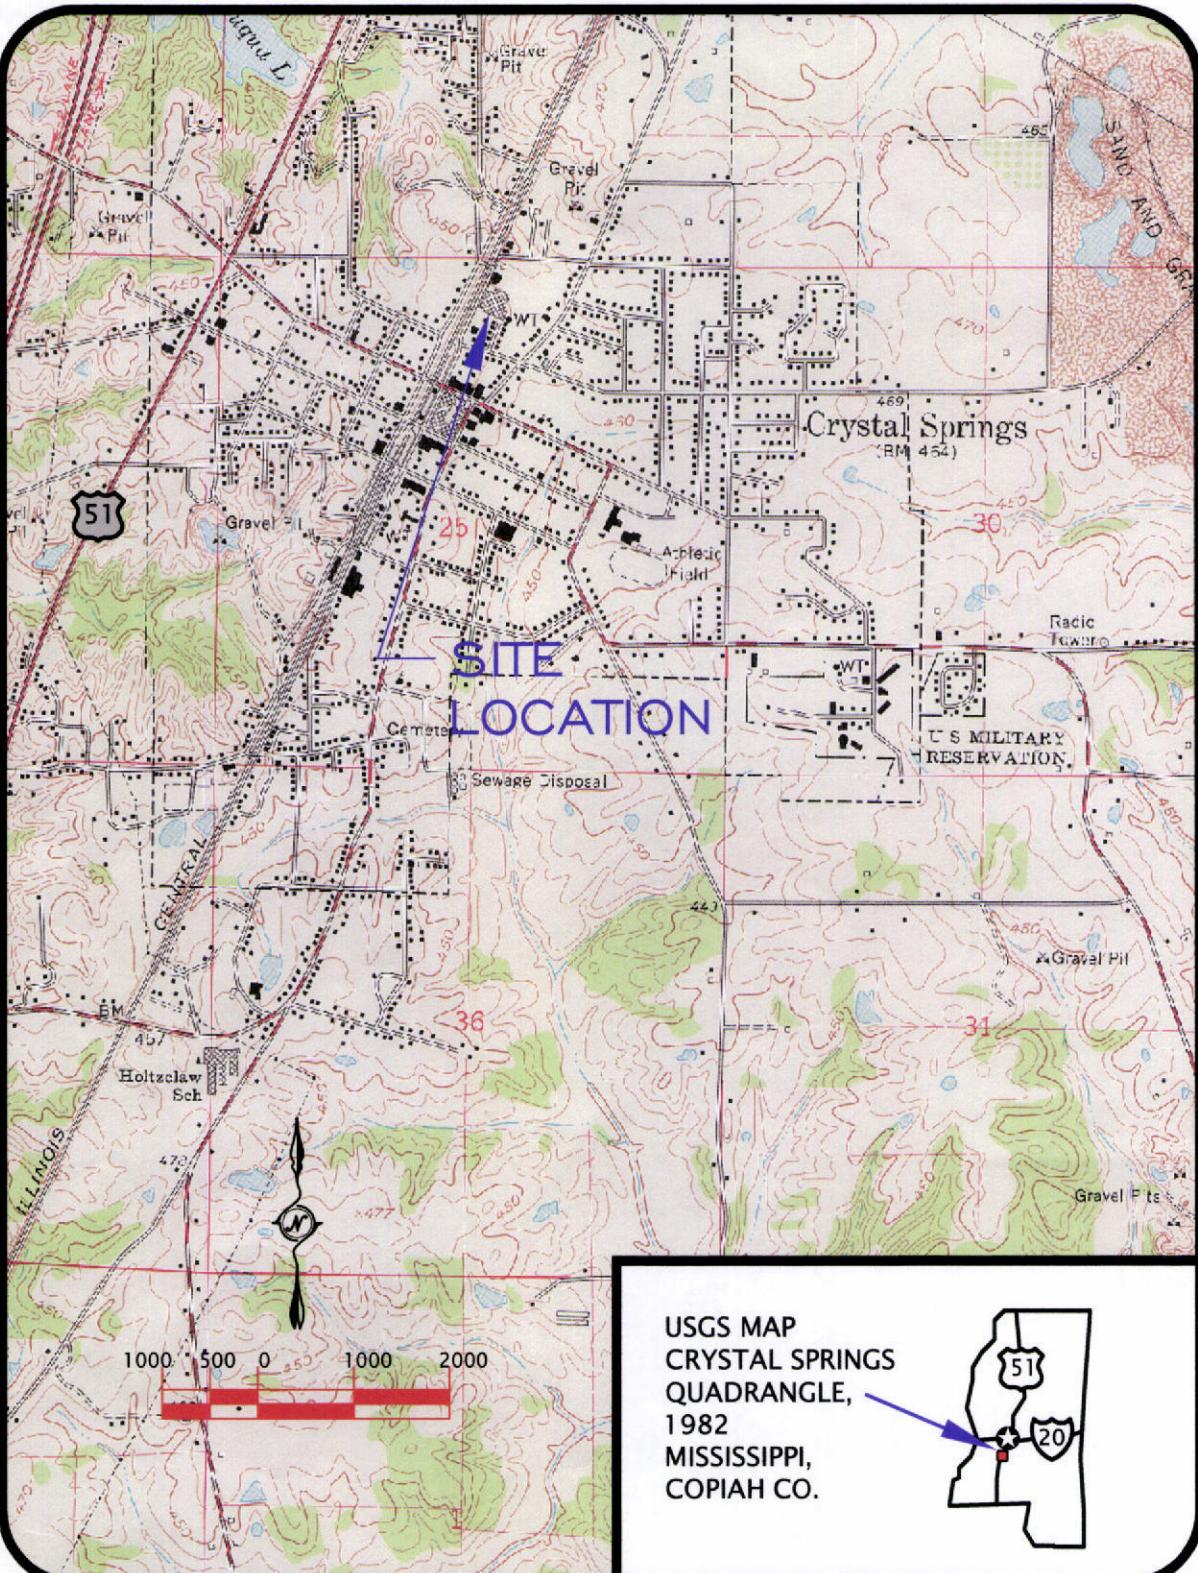

## **5.0 CONCLUSIONS AND RECOMMENDATIONS**

The data presented in this report for the municipal water supply wells and municipal supply line indicate that one of the municipal wells CSW-WA1 is showing low levels of 1,1-DCE and 1,4-dioxane. The detected concentrations of 1,1-DCE and 1,4-dioxane are slightly above their respective laboratory reporting limits but well below their respective TRGs. No contaminants were detected at the municipal supply line. The monthly sampling events for the municipal wells and municipal supply line will continue.

The December 2008 sampling event plume maps, are provided in Figures 3 and 4 1,1-DCE and 1,4-dioxane, respectively,

A potentiometric contour map is included as Figure 5.

1. Sample had Well ID of CSW-WA5 during the 9-7-04 sampling event
2. Sample had Well ID of CSW-WA3 during the 9-7-04 sampling event

Concentrations reported in  $\mu\text{g/L}$ .

A result of ( - ) indicates this municipal well was not sampled and/or analyzed during the specified monitoring event

NC = Sample not collected due to pump failure

3. Sample had Well ID of CSW-WA4 during the 9-7-04 sampling event

4. Well taken off-line by the City of Crystal Springs after November 2005.

Concentrations reported in  $\mu\text{g/L}$

A result of ( - ) indicates this municipal well was not sampled and/or analyzed during the specified monitoring event

NC = Sample not collected due to pump failure

Concentrations in bold exceed the MDEQ Target Remediation Goal for 1,1-DCE of 7.0  $\mu\text{g/L}$

5. Sample had Well ID of CSW-WA6 during the 9-7-04 sampling event

MDEQ Tier 1 Target Remediation Goal (TRG) for 1,4-Dioxane is 6.09 µg/L (ppb).

Concentrations reported in µg/L.  
A result of (-) indicates sample was not collected and/or analyzed during the specified monitoring event.

1. MW-1 was permanently closed March 2005

2. MW-4 was converted to a flushmount well - above ground riser removed altering the TOC elevation

DTW = depth to water  
TOC = top of casing  
GW = groundwater

Results reported in micrograms per liter ( $\mu\text{g/L}$ )

Concentrations in bold exceed their respective MDEQ Tier 1 TRG

A result of (-) indicates that 1,4-dioxane was not analyzed for during the specified sampling event

Results reported in micrograms per liter (µg/L)

Concentrations in bold exceed their respective MDEQ Tier 1 TRG

A result of (-) indicates that 1,4-dioxane was not analyzed for during the specified sampling event

Results are reported in micrograms per liter (µg/L)

Concentrations in **bold** exceed their respective MDEQ Tier 1 TRG

J: indicates concentration reported between method detection limit and reporting limit

Table 5A  
 Off-site Laboratory  
 Summary of Off-Site Monitoring Well Sample Results for VOCs and 1,4-Dioxane  
 July 2007 through December 2008  
 Kuhlman Electric Corporation  
 Crystal Springs, MS

Well ID	Off-site lab Sample ID	Sample ID	Date Collected	Time Collected	VOCs Date Analyzed	1,4-Dioxane Date Analyzed	7	786	5	200	2	0.155	5	0.000	5	0.000	1,4-Dioxane
