APPENDIX A GROUNDWATER COLLECTION LOGS

APPENDIX B LABORATORY ANALYTICAL RESULTS

1.0 INTRODUCTION

Hercules Incorporated (Hercules) commissioned Eco-Systems, Inc. (Eco-Systems) to conduct quarterly groundwater and surface water monitoring at the Hattiesburg, Mississippi facility. The site location is shown in Figure 1. The work is being conducted in accordance with the Corrective Action Plan Revision 01 (CAP) prepared by Groundwater & Environmental Services, Inc. (GES) dated January 20, 2005, which was approved by the Mississippi Department of Environmental Quality (MDEQ) in a letter dated January 25, 2005.

As discussed in the CAP, groundwater monitoring wells MW-2 through MW-19 and the sampling locations established in Green's Creek are being monitored quarterly to provide groundwater and surface water quality information

This report describes sampling activities and analytical results for the third quarterly monitoring event of the second year of monitoring being conducted under the CAP. During this event, water levels were measured at 18 wells and 15 piezometers, surface water samples were collected from six locations, and groundwater samples were collected from 18 monitoring wells.

Samples collected during this monitoring event were analyzed for Volatile Organic Constituents (VOCs). Samples collected during previous quarterly monitoring events have also been analyzed for dioxathion and dioxenehion. However, the MDEQ approved Hercules request to discontinue dioxathion and dioxenehion analyses in a letter to Hercules dated August 18, 2006. Per the conditions in the August 18, 2006 letter, future analyses for dioxathion and dioxenehion will be conducted during the annual monitoring event scheduled for May 2007 and confined to samples collected from seven monitoring wells designated by the MDEQ. Discussion of detections of dioxathion and dioxenehion will be presented in the annual monitoring report.

2.0 FIELD ACTIVITIES

Field activities conducted during this quarterly sampling event include sample collection from 18 monitoring wells and 6 surface water monitoring locations. Groundwater and surface water samples were analyzed for Appendix IX VOC's.

2.1 GROUNDWATER SAMPLE COLLECTION

On February 26, 2007 Eco-Systems personnel collected groundwater levels from the 18 monitoring wells to be sampled during the quarterly monitoring event and from the 15 piezometers at the site. Piezometer TP-1 was damaged by site activities and the groundwater level could not be measured at this location. A summary of the water level measurements obtained on February 26, 2007 is included as Table 1.

Groundwater sample collection was conducted on February 27-28, 2007. Prior to collecting a groundwater sample, the monitoring wells were purged using either low-flow/low-stress techniques or traditional volume based methods. Purging was conducted until temperature, pH, specific conductance, and turbidity had stabilized. The water quality field parameters were measured with calibrated instruments and recorded in the field book along with the cumulative amount of water evacuated and time of batch parameter testing. Groundwater collection logs are attached as Appendix A.

Once field parameters stabilized, groundwater collected for analysis was sampled simply by collecting water directly into new sample containers supplied by the analytical laboratories. During the collection of field replicates that were collected for QA/QC concerns, alternating aliquots were placed in each replicate bottle until each bottle is filled.

In general, the order of sampling was from least impacted to most impacted based on historical data. Tubing used during purging and sampling was either dedicated to each well or disposed of after use. Subsequent to sampling, sample containers were labeled, placed and sealed on ice and shipped to the designated offsite laboratory for analysis. Chain-of-custody documentation accompanied the sample cooler. Personnel involved in sampling used clean, disposable gloves, which were changed between each sample collection. All non-disposable sampling equipment was decontaminated as outlined in Section 2.4

During this investigation, groundwater samples were collected from permanent monitoring wells MW-2 through MW-19. Filled sample vials were immediately placed in a cooler containing sufficient ice to lower the temperature of the filled sample vials

below 4°C. Groundwater samples were shipped via overnight courier to Severn Trent Laboratories in Savannah, Georgia for VOC analysis.

2.2 SURFACE WATER SAMPLE COLLECTION

On February 26, 2007, six surface water samples were collected from the previously established sampling points along Green's Creek, CM-0 to CM-5. Samples were collected beginning with the most downstream location and proceeding upstream to each successive sampling location. Surface water samples were collected directly into new glass sample containers that were supplied by the analytical laboratory. The filled sample containers were labeled, packed and shipped/delivered in the same manner as groundwater samples discussed in Section 2.2.

2.3 QUALITY ASSURANCE/QUALITY CONTROL

For quality assurance/quality control (QA/QC) purposes, two duplicate groundwater samples, three rinseate samples, one trip blank sample, and three matrix spike and matrix duplicate (MS/MSD) were collected during field sampling activities. The duplicate groundwater samples were collected in alternating aliquots that were placed in each replicate bottle until each bottle was filled. The rinseate samples were prepared by pouring deionized water over groundwater sampling tubing and collecting the rinseate into new disposable sample containers supplied by the analytical laboratory. QA/QC samples were labeled, stored and shipped in the same manner as groundwater and surface water samples. QA/QC samples were analyzed for the same constituents as groundwater and surface water samples.

2.4 DECONTAMINATION

In general, groundwater sampling equipment that would contact the groundwater sample was single-use, disposable equipment. For any re-usable groundwater sampling equipment decontamination was accomplished by the following procedure:

- 1) Phosphate-free detergent wash.
- 2) Potable water rinse.
- 3) Deionized water rinse.
- 4) Isopropanol rinse.
- 5) Organic-free water rinse or air dry.

If it was necessary to store or transport decontaminated equipment, the decontaminated equipment was placed in either a new, disposable plastic bag or wrapped in aluminum foil.

2.5 OTHER PROCEDURES

Procedures for sample collection, sample containerization and packing, sample shipment, cross-contamination control, drummed material disposal, field documentation, chain-of-custody, data review, and other work items not specifically covered in this document were conducted in accordance with the Environmental Investigations Standard Operating Procedures and Quality Assurance Manual (EPA Region IV, May, 2001), (EISOPQAM)

3.0 LABORATORY ANALYTICAL RESULTS

Groundwater and surface water samples collected from the Hercules site were analyzed for Appendix IX VOC's according to U.S. EPA Method 8260B. Laboratory analytical reports for the samples collected during this investigation are included in Appendix B and summarized in Table 2 and Table 3.

3.1 GROUNDWATER

VOC's were not detected at concentration above TRGs in groundwater samples collected from wells MW-02, MW-03, MW-04, MW-05, MW-06, MW-07, MW-10, MW-11, MW-12, MW-14, MW-15, MW-16, and MW-18.

Analysis of the groundwater sample collected from monitoring well MW-08 detected benzene, carbon tetrachloride, and chloroform at concentrations above their TRG's.

Analysis of the groundwater sample collected from monitoring well MW-09 detected benzene at concentrations greater than its associated TRG.

Analysis of the groundwater sample collected from the monitoring well MW-13 detected benzene, carbon tetrachloride, and chloroform at concentrations greater than their respective TRG's.

Analysis of the groundwater sample collected from monitoring well MW-17 detected benzene, chlorobenzene, toluene, chloroform and carbon tetrachloride at concentrations above their respective TRG's.

Analysis of the groundwater sample collected from monitoring well MW-19 detected benzene at a concentration above its associated TRG.

3.2 SURFACE WATER

VOC's were detected in surface water samples collected from locations CM-00, CM-01, CM-02, CM-03, CM-04 and CM-05.

Analysis of the surface water sample collected from location CM-00 detected acetone at a concentration below its associated TRGs.

Analysis of the surface water sample collected from location CM-01 detected acetone at a concentration below its associated TRG.

*Quarterly Monitoring Report
February 2007 Sampling Event
Hercules Incorporated
Hattiesburg, Mississippi*

Analysis of the surface water sample collected from location CM-02 detected acetone at a concentration below its associated TRG.

Analysis of the surface water sample collected from location CM-03 detected acetone at a concentration below its associated TRG.

Analysis of the surface water sample collected from location CM-04 detected acetone and benzene at concentrations below their associated TRG.

Analysis of the surface water sample collected from location CM-03 detected benzene at a concentration below its associated TRG.

3.3 QA/QC

Analytical reports for the QA/QC samples are included in Appendix B and summarized in Table 3.

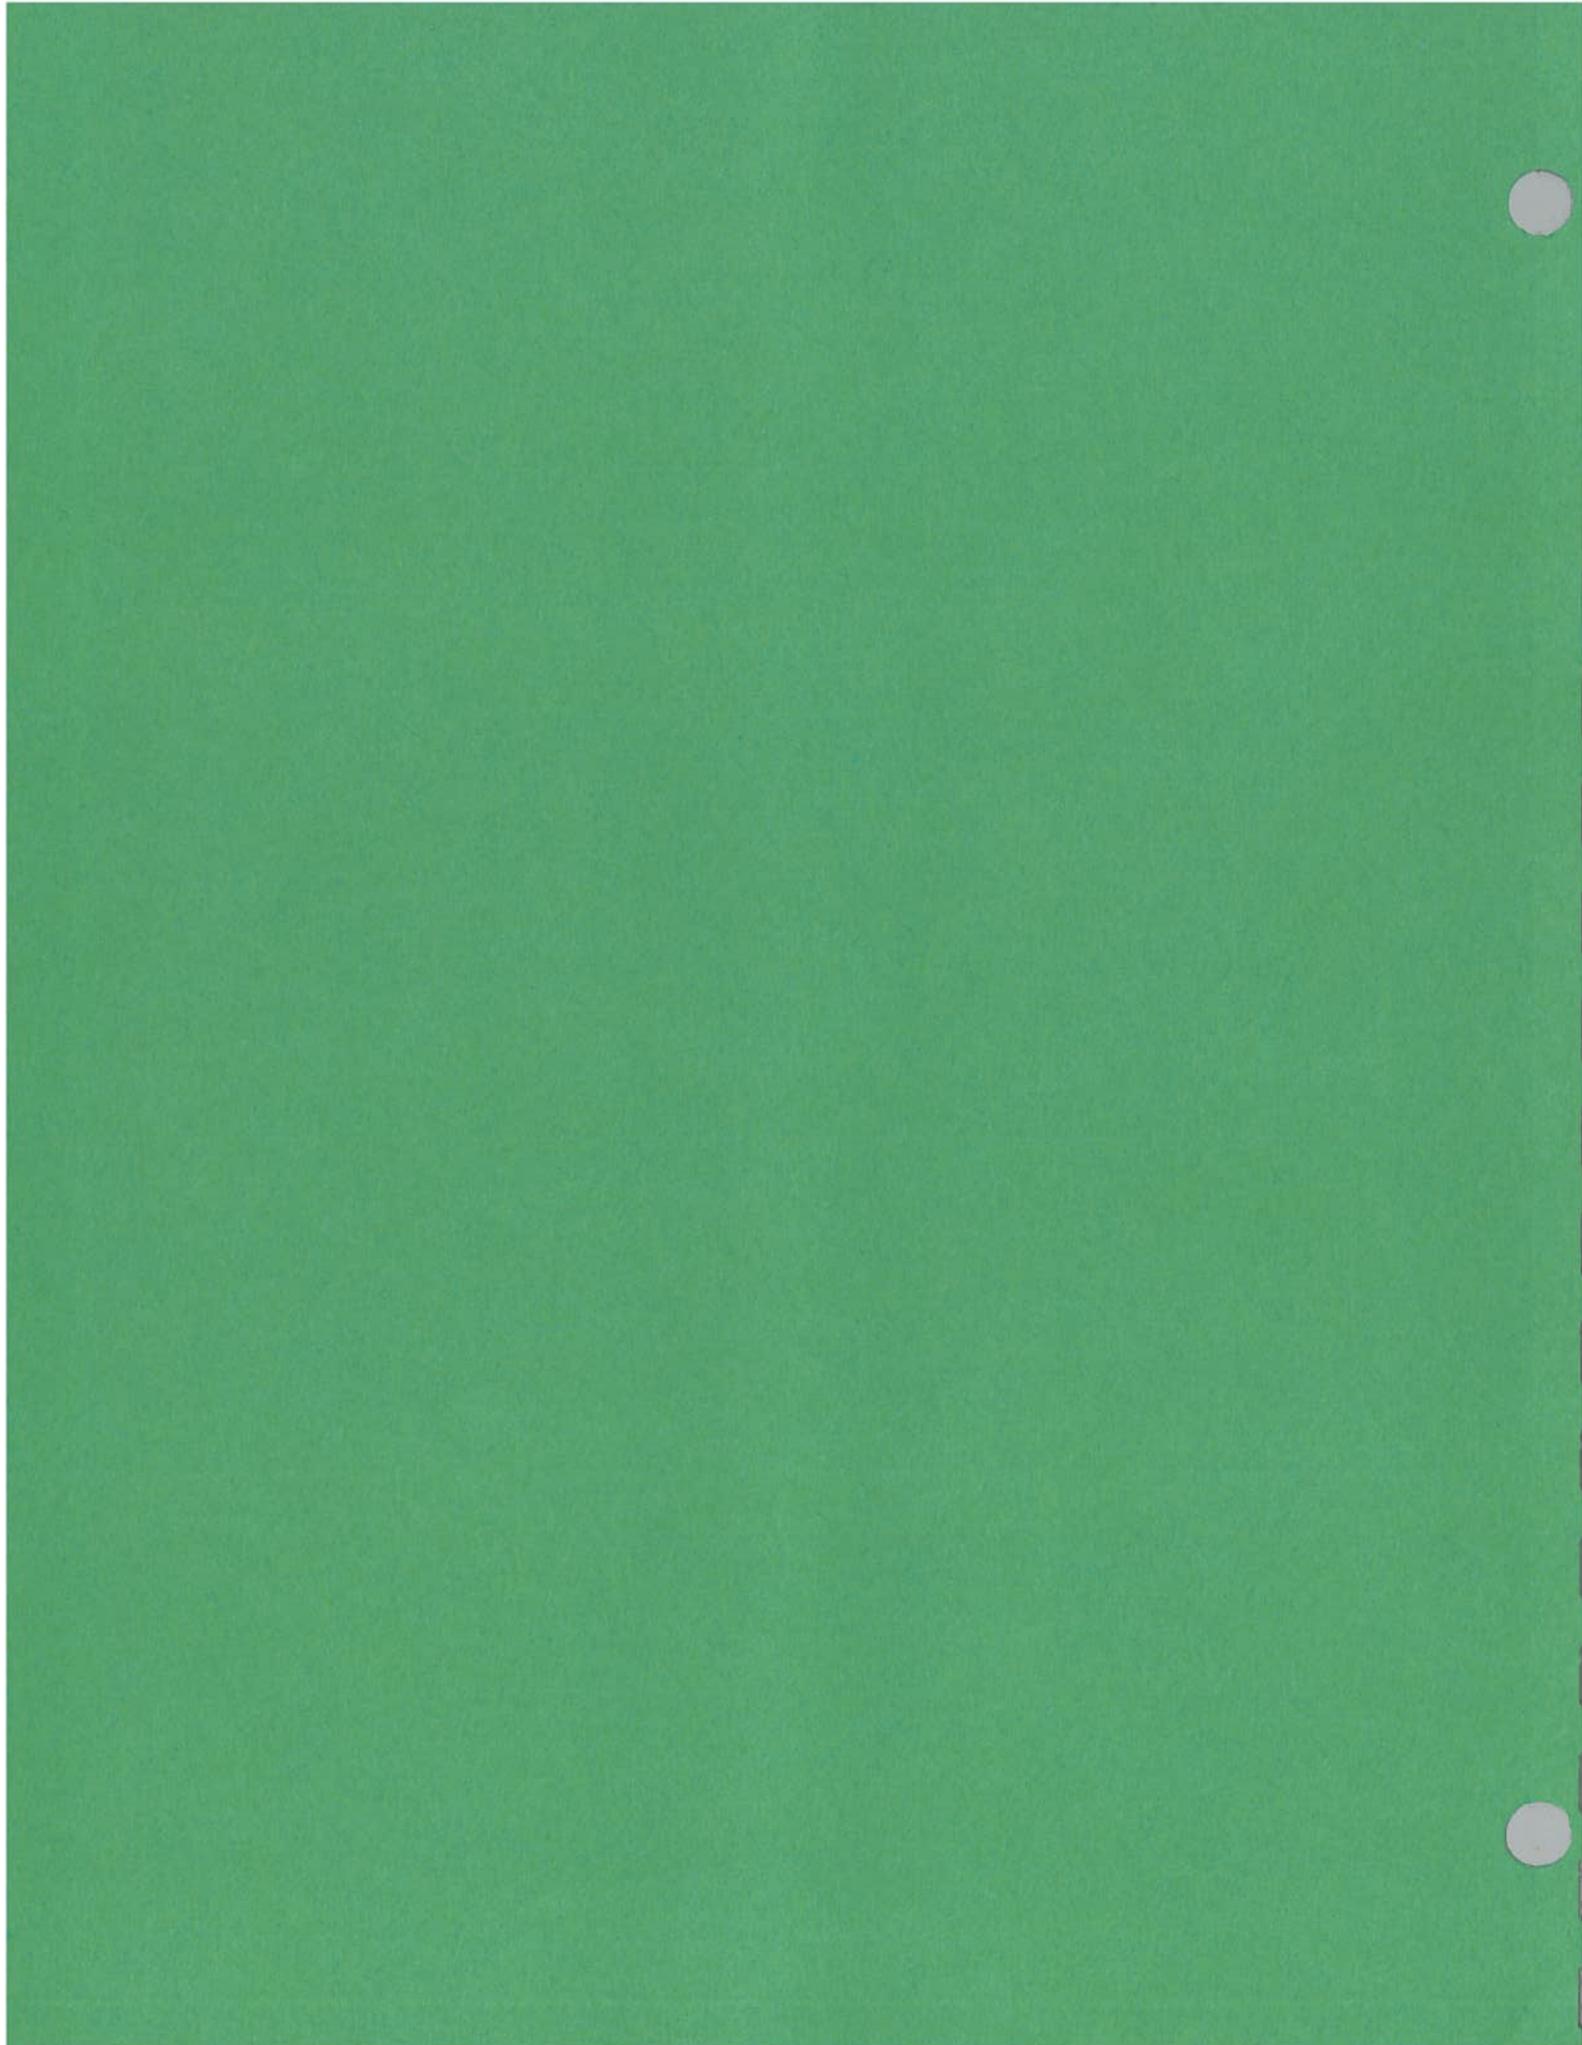

Duplicate groundwater samples were collected from MW-04 and MW-13. Review of the laboratory data indicated that the regular sample collected from monitoring well MW-04 and the duplicate sample (FD-01) were included in the same analytical batches. Constituents were not detected in the regular or duplicate samples collected from MW-04.

Variation in the analytical results for detected constituents in the duplicate sample (FD-02) collected from MW-13 generally ranged from 7% to 13%. Analysis of the duplicate groundwater sample collected

VOC's were not detected in the rinseate samples collected during this sampling event. VOC's were not detected in the trip blank that accompanied the samples collected during this sampling event.

Review of the analytical reports for VOC's that were submitted by STL indicates that spike sample recoveries for the spiked volatile organic constituents in the MS and MSD samples were within the acceptable recovery ranges reported by the laboratory for each of the spiked constituents.

As reported by STL, all method blanks were non-detect for VOC's. The laboratory QC spike sample recoveries for VOC's detected in site samples were within the limits reported by the laboratory. Analyses were conducted within the 14 day holding time.

GROUNDWATER SAMPLE CONTAINERS			
Date	Time	Sample Container	Preservative
02-28-07	1230	5-40ml VOA	HCL

Sample Identification: HER-MW09-022807

Weather Conditions During Sampling: Cloudy @ 65°F

Comments:

Sample Technician: CT/TB

Date: 02-28-2007

Notes: ft-btc = feet below top of casing.
 gal = gallons.
 mS/cm = millisiemens per centimeter.
 °C = degrees Celsius.
 NTU = Nephelometric Turbidity Units.
 mg/L = milligrams per liter.
 mV = millivolts.

Project Name: Hercules Boring ID: MW13
 Project Number: HTR 25080-CL-M5 Site Location:

Start Date: 02-28-2007 Finish Date: 02-28-2007
 Sample Technician: CARL TERRELL / TRAVIS BEARD
 Purge/Sample Method: Peristaltic Pump
 Well Diameter (d): 2"
 Total Depth (TD): 18.5
 Approximate Depth of Water Column (h):
 (h = TD - DTW [ft-bloc])
 Calculated Well Volume (V=6hd²):
 (V = vol in gal; d = well diam. in ft):

Depth-to-Water (DTW) Measurements	
Date	DTW (ft-bloc)
