INTRODUCTION

The Mississippi Bureau of Geology currently maintains a large file of electrical logs of water wells and test holes drilled in the State. Since the implementation of the present logging program, in 1964, over 5800 electrical logs have been recorded and added to the Bureau's open file. Most of these logs were recorded by the Bureau of Geology and the United States Geological Survey. Some commercial electrical logs of water wells and test holes are also contained in the files.

This report contains over 1100 electrical logs that were recorded between January 1, 1979, and December 31, 1984. The information contained in this report is the result of additional logs that have been recorded since the previous edition (1979) was published by the Bureau of Geology. For reference to maps, locations, and other illustrations and tables, this supplement should be accompanied by "Electrical Logs of Water Wells and Test Holes on File at the Bureau of Geology and Energy Resources," (Information Series BGE-79-1).

Data obtained from electrical logs offer great benefits to geologists, engineers, well contractors, and individual well owners. These logs can be interpreted to determine lithology, geometry, aquifer characteristics, correlation, thickness, and composition of rock units. Sampling of the rocks and fluids penetrated by drilling and geophysical well logging are the only ways information can be obtained from drill holes or wells. Valid logs that are correctly interpreted can be used to reduce drilling costs by guiding the location, proper drilling, and construction of water wells.

Electrical logs and samples obtained by the Bureau of Geology are public property and are made available for inspection by any contractor, official, geologist, or individual. Copies of these logs are available at a nominal charge to cover reproduction costs.

LOGGING POLICY

The Bureau of Geology will log water wells or other boreholes throughout the State that are not normally logged by a commercial logging company. The service is limited by funds available, quality, quantity, and location of information to be derived, and availability of logging equipment and operating personnel. Upon completion of logging, the operator is directed to bring the best tracing back to the Bureau for completion. The Bureau will mail finished prints of logs according to distribution instructions furnished. This will be done within 24 hours of the logging date whenever practical.

Advance notice for logging service is requested so that logging schedules can be established on the basis of prior commitment and availability of equipment and personnel. The electrical logging service is available from 8:00 A.M. to 5:00 P.M., Monday through Friday. Proper planning on the part of the contractor is requested in order to enable the logging operator to perform the logging service and return to the office during normal working hours.

The Bureau of Geology desires representative samples from each 10-foot or 20-foot interval drilled on holes throughout the State. These samples aid in the interpretation of data acquired from electrical logs. Sample bags are furnished to the contractor for this purpose.

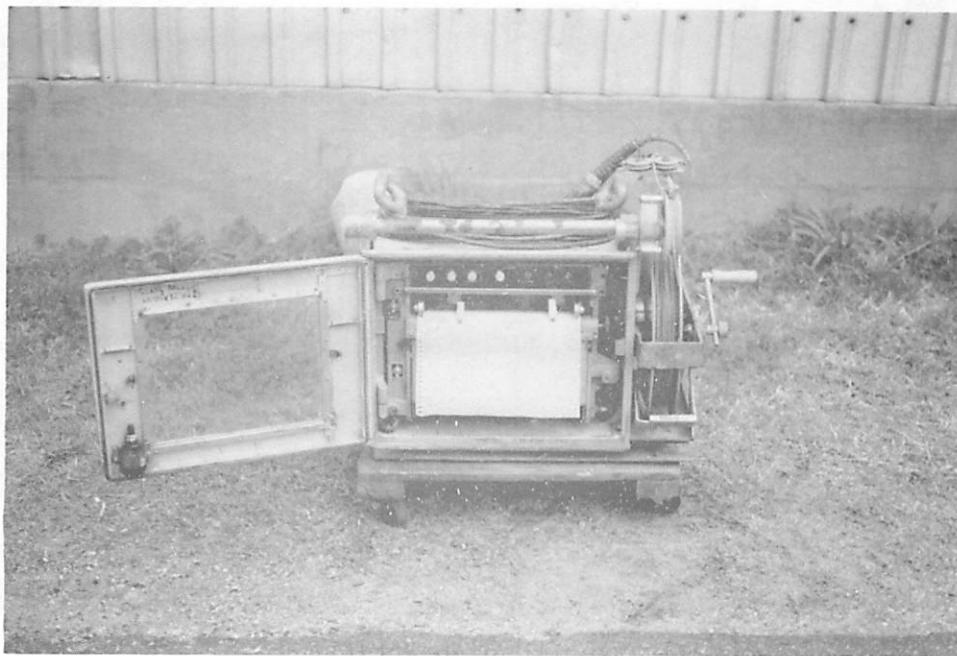

The Bureau assumes no liability for any damage that might result in the irretrievable loss of logging equipment in the borehole. The Bureau will normally assume responsibility for damage or loss of its equipment unless through negligence or willful act of the contractor or his representative.

These regulations and policies are subject to review and amendment by the Bureau of Geology at any time, but are herein stated as guidelines to procedure for the logging program.

TYPE OF EQUIPMENT

The Bureau of Geology currently operates three logging instruments, each capable of recording a self potential and a resistivity curve simultaneously. One of the instruments is portable; the others are mounted in suitable vehicles and are equipped to record gamma ray logs as well.

The portable Widco logger is normally equipped with sufficient neoprene-insulated cable to log to a depth of 950 feet. This logging device is small and can be carried to any site in a pick-up or passenger car. It records a self potential and a single point resistance curve simultaneously and is raised and lowered in the borehole manually with a geared hand-crank. Electrical power needed to operate this unit is supplied by a 115 volt AC rotary convertor powered by an ordinary 12 volt car battery. This unit is used primarily to log shallow test holes for the Bureau, but it is also used in the logging program when necessary.

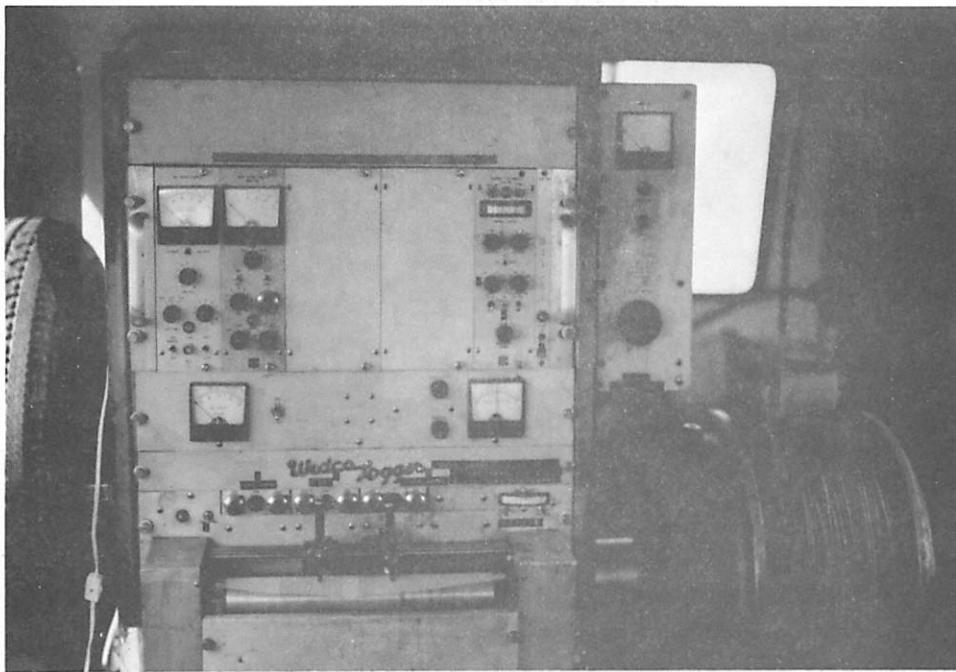

WIDCO PORTABLE SINGLE-POINT LOGGER

The Bureau of Geology also operates two truck-mounted logging devices, each of which are more advanced than the portable Widco. These logging instruments, the Gearheart-Owens and the Log Master, are multipurpose logging devices that record three curves simultaneously. Two of these curves record resistivity coinciding with electrical penetrations of 16 and 64 inches into the formations drilled, while a third curve records the spontaneous potential. Both logging instruments are also equipped to record natural gamma ray logs. Presently, a Kohler 2250 watt AC generator is used to supply the required 115 volt AC current for the operation of the Gearheart-Owens. The Log Master has a Dayton 3000 watt AC generator as its power source.

The Gearhart-Owens is normally equipped with approximately 3000 feet of four-conductor, steel-armored cable. The Log Master is equipped with approximately 4000 feet of four-conductor, steel-armored cable.

ELECTRICAL LOGS IN MISSISSIPPI

Since July 1, 1964, the Bureau of Geology has kept a record of all water wells and test holes logged with its instruments. The number of logs recorded throughout the State, as of December 31, 1984, exceeds 5800. This tabulation also includes logs recorded by the U. S. Geological Survey as well as some commercial logs on water wells in the State. The combination of logs acquired from other sources has enabled the Bureau to accumulate enormous geological information. At the same time, an invaluable service to the water well industry is offered.

Figures 1 through 82 show locations of water wells and various other boreholes in the counties of the State for which the Bureau has electrical logs available. These locations represent logs recorded between January 1, 1979, and December 31, 1984. The numbers shown by each location indicate the Bureau's file numbers for the electrical logs on those drill hole locations.

Tables 1 through 82 are tabulations of electrical logs in Mississippi by individual county that were recorded between January 1, 1979, and December 31, 1984. The logs are tabulated by individual county and listed numerically and alphabetically by Bureau file number. Other pertinent information such as ownership, agency that recorded the log, location, log interval, and date is also included in the tabulations.

ACKNOWLEDGMENTS

The Bureau of Geology wishes to acknowledge the cooperation and assistance provided by the Water Resources Division of the U. S. Geological Survey. The access to data and the help of U. S. Geological Survey personnel are greatly appreciated.
