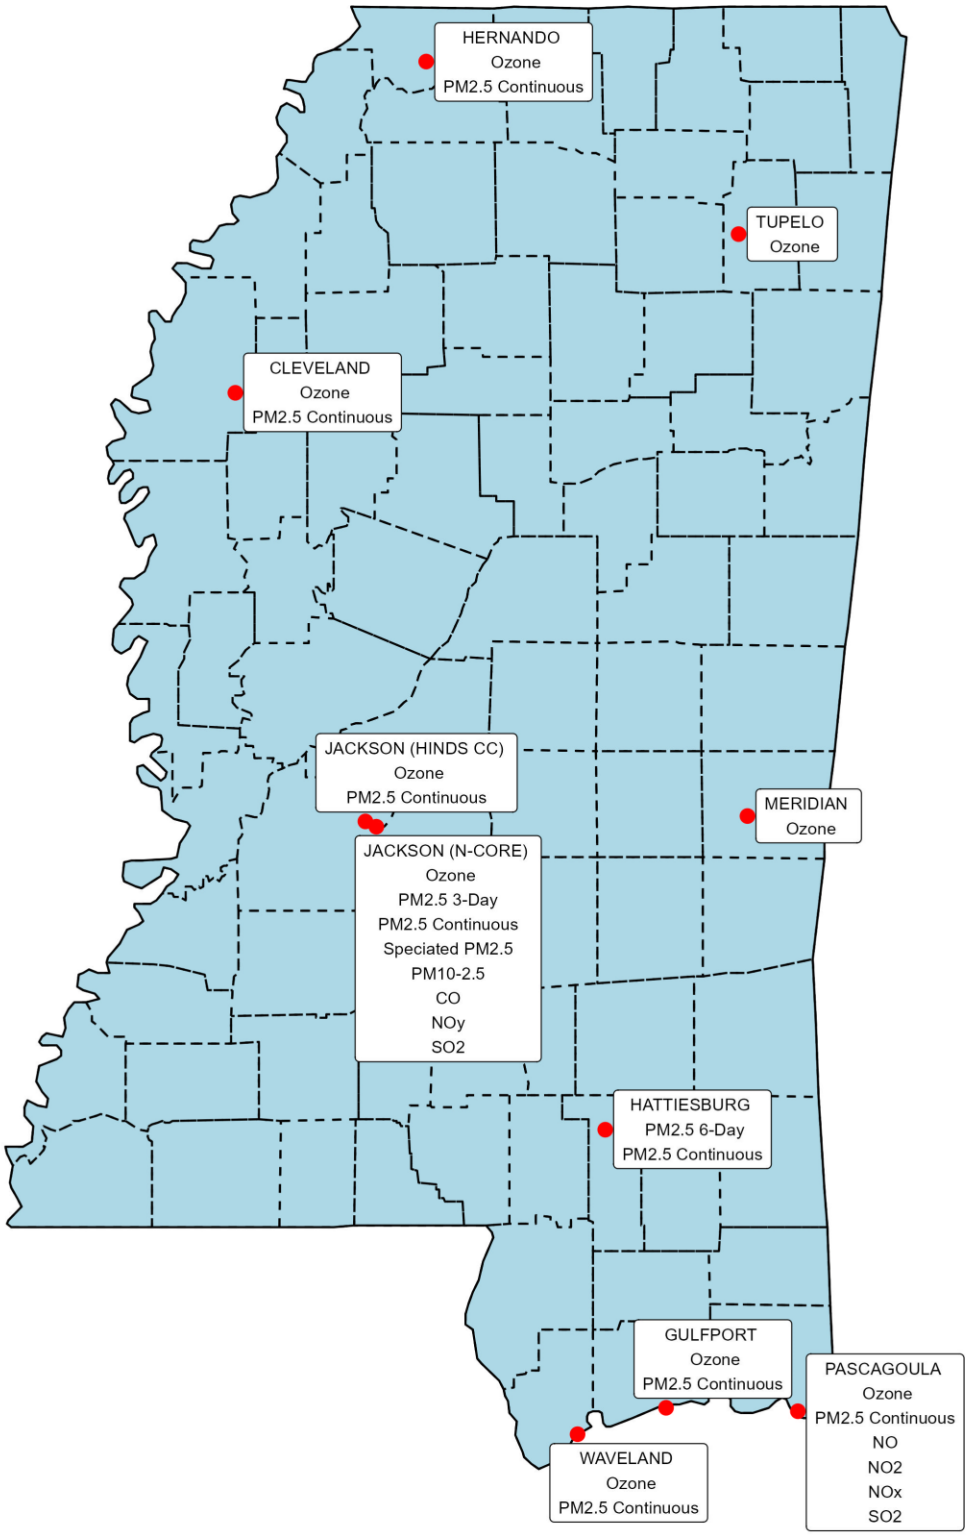
Introduction

Under the Clean Air Act, the U.S. Environmental Protection Agency (EPA) establishes primary air quality standards to protect public health, including the health of "sensitive populations such as people with asthma, children, and older adults". EPA also sets secondary standards to protect public welfare. This includes protecting ecosystems, including plants and animals, from harm, as well as protecting against decreased visibility and damage to crops, vegetation, and buildings.

EPA has set national ambient air quality standards (NAAQS) for six principal air pollutants (also called criteria pollutants): Ground-Level Ozone (O_3), Particulate Matter (PM), Nitrogen Dioxide (NO_2), Sulfur Dioxide (SO_2), Carbon Monoxide (CO), and Lead (Pb). The Mississippi Department of Environmental Quality (MDEQ) monitors all of these pollutants with the exception of lead. MDEQ ceased lead monitoring on June 30, 2016.

This report shows the monitored levels of criteria pollutants at sites in Mississippi during calendar year 2022 and compares these levels to the NAAQS to demonstrate whether the state is meeting the standards. The results show that Mississippi is in compliance with all current NAAQS.

2022 MDEQ Air Monitoring Network



Monitoring Network Information

County	City	Monitoring Site ID	Pollutants Monitored	Latitude			Longitude		
				Deg.	Min.	Sec.	Deg.	Min.	Sec.
Bolivar	Cleveland	28-011-0002	Ozone, $PM_{2.5}$ Continuous	33	45	03	-90	44	03

NAAQS Table

Pollutant [links to historical tables of NAAQS reviews]		Primary/ Secondary	Averaging Time	Level	Form
Carbon Monoxide (CO)		primary	8 hours	9 ppm	Not to be exceeded more than once per year
			1 hour	35 ppm	
Lead (Pb)		primary and secondary	Rolling 3-month average	0.15 µg/m^3 (1)	Not to be exceeded
Nitrogen Dioxide (NO_2)		primary	1 hour	100 ppb	98th percentile of 1-hour daily maximum concentrations, averaged over 3 years
		primary and secondary	1 year	53 ppb (2)	Annual Mean
Ozone (O_3)		primary and secondary	8 hours	0.070 ppm (3)	Annual fourth-highest daily maximum 8-hour concentration, averaged over 3 years
Particle Pollution (PM)	$PM_{2.5}$	primary	1 year	12.0 µg/m^3	annual mean, averaged over 3 years
		secondary	1 year	15.0 µg/m^3	annual mean, averaged over 3 years
		primary and secondary	24 hours	35 µg/m^3	98th percentile, averaged over 3 years
	PM_{10}	primary and secondary	24 hours	150 µg/m^3	Not to be exceeded more than once per year on average over 3 years
Sulfur Dioxide (SO_2)		primary	1 hour	75 ppb (4)	99th percentile of 1-hour daily maximum concentrations, averaged over 3 years
		secondary	3 hours	0.5 ppm	Not to be exceeded more than once per year

(1) In areas designated nonattainment for the Pb standards prior to the promulgation of the current (2008) standards, and for which implementation plans to attain or maintain the current (2008) standards have not been submitted and approved, the previous standards (1.5 µg/m3 as a calendar quarter average) also remain in effect.

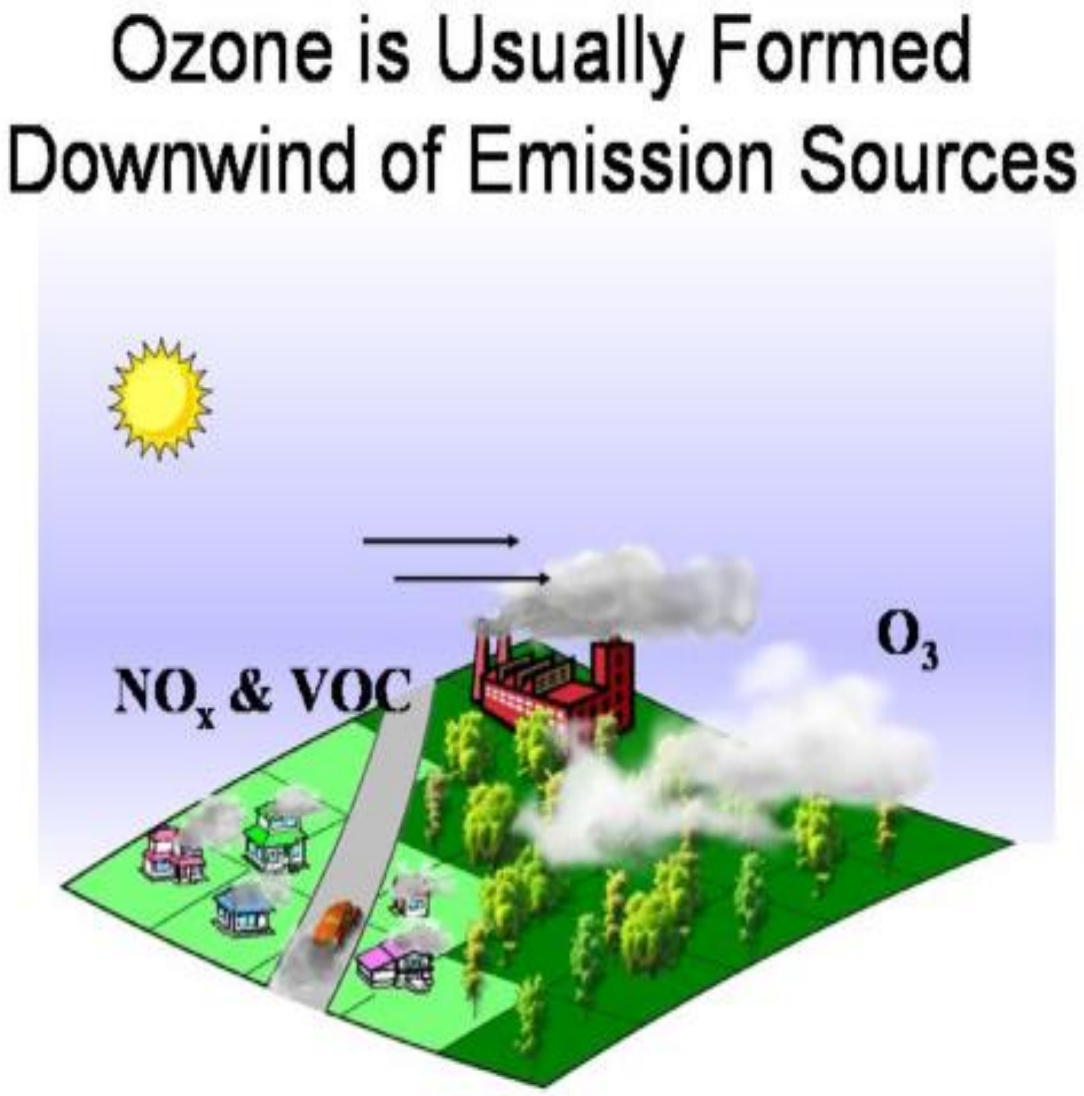
(2) The level of the annual NO_2 standard is 0.053 ppm. It is shown here in terms of ppb for the purposes of clearer comparison to the 1-hour standard level.

(3) Final rule signed October 1, 2015, and effective December 28, 2015. The previous (2008) O_3 standards are not revoked and remain in effect for designated areas. Additionally, some areas may have certain continuing implementation obligations under the prior revoked 1-hour (1979) and 8-hour (1997) O_3 standards.

(4) The previous SO_2 standards (0.14 ppm 24-hour and 0.03 ppm annual) will additionally remain in effect in certain areas: (1) any area for which it is not yet 1 year since the effective date of designation under the current (2010) standards, and (2)any area for which an implementation plan providing for attainment of the current (2010) standard has not been submitted and approved and which is designated nonattainment under the previous SO_2 standards or is not meeting the requirements of a SIP call under the previous SO_2 standards (40 CFR 50.4(3)). A SIP call is an EPA action requiring a state to resubmit all or part of its State Implementation Plan to demonstrate attainment of the required NAAQS.

Ground-Level Ozone (O_3)

Ozone is a gas composed of three atoms of oxygen. Ozone occurs both in the Earth's upper atmosphere and at ground level. Ozone can be good or bad, depending on where it is found. It occurs naturally in the stratosphere approximately 6 to 30 miles above the Earth's surface where it forms a protective layer that shields us from the sun's harmful ultraviolet rays. In the Earth's lower atmosphere, near ground level, ozone occurs naturally in lower amounts. Additional ground-level ozone is formed when nitrogen oxides (NO_x) and volatile organic compounds (VOCs) emitted by cars, power plants, industrial boilers, refineries, chemical plants, and various other sources react chemically in the presence of sunlight. Because this reaction takes time to occur, ozone is usually formed downwind of emission sources.



Ozone Standard

There is one primary and secondary ozone standard – the 8-hour average. MDEQ monitors ozone continuously from March 1st through October 31st each year at the monitoring sites listed below. Ozone is monitored year around at our N-CORE site located in Jackson.

Primary and Secondary 8-Hour Standard- 70 ppb

The 8-hour standard is met when the 3-year average of the annual fourth highest daily maximum 8-hour average concentration (also known as the design value) is less than or equal to 0.070 parts per million (ppm) or 70 parts per billion (ppb).

Particulate Matter

In general, particulate matter consists of a mixture of larger materials, called “coarse particles”, and smaller particles, called “fine particles”. Coarse particles have diameters ranging from 2.5 micrometers (µm) to more than 40 µm, while fine particles, also known as $PM_{2.5}$, include particles with diameters equal to or smaller than 2.5 µm. MDEQ also monitors PM_{10}, which refers to particles less than or equal to 10 µm in diameter.

These tiny particles come in many shapes and sizes and can be made up of hundreds of different chemicals. Some particles are emitted directly from a source, while others form in complicated chemical reactions in the atmosphere.

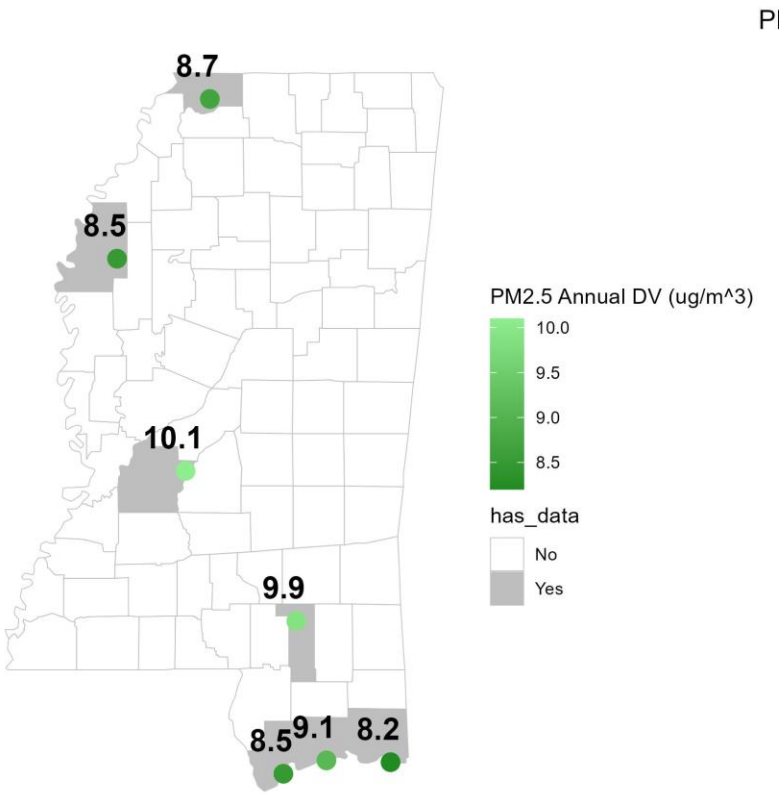
$PM_{2.5}$ Standards

There are two primary and secondary $PM_{2.5}$ standards – (1) the Annual Average and (2) the 24-Hour Average. MDEQ monitors $PM_{2.5}$ continuously at the monitoring sites listed below.

Primary and Secondary Annual Standard – 12.0 µg/m^3 and 15.0 µg/m^3, respectively

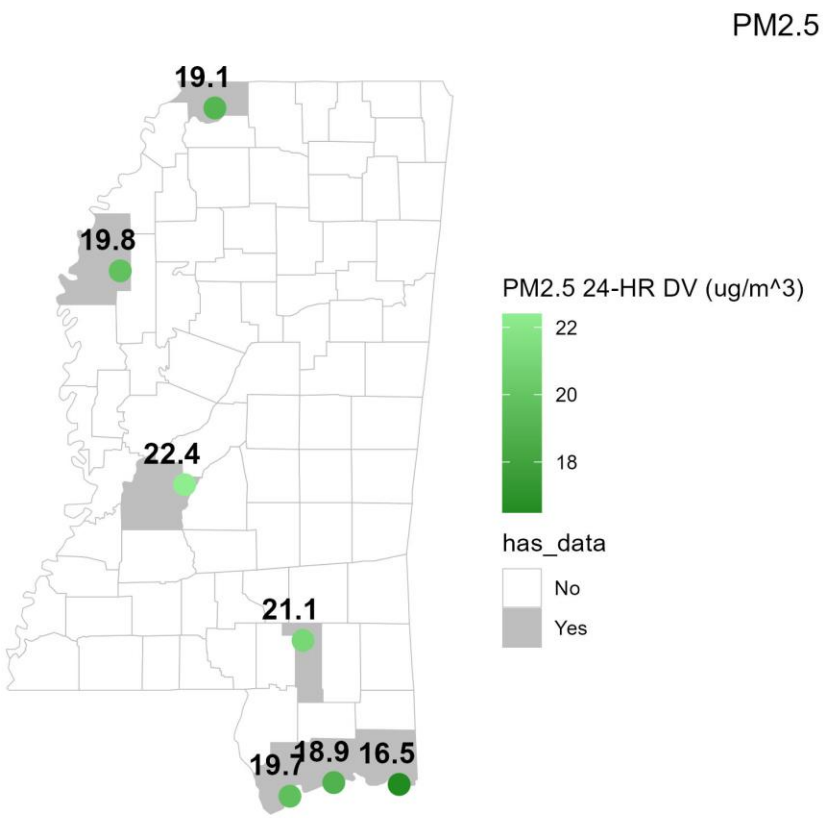
The annual average primary standard is met when the three-year average of the annual averages does not exceed 12.0 micrograms per cubic meter (µg/m^3). The annual average secondary standard is met when the three-year average of the annual averages does not exceed 15.0 micrograms per cubic meter (µg/m^3).



PM Site	County	Year	PM2.5 2022 Annual DV
Cleveland Delta State	Bolivar	2022	8.5
Hernando	DeSoto	2022	8.7
Hattiesburg	Forrest	2022	9.9
Waveland	Hancock	2022	8.5
Gulfport Youth Court	Harrison	2022	9.1
Hinds CC	Hinds	2022	9.8
Jackson NCORE	Hinds	2022	10.1
Pascagoula	Jackson	2022	8.2

Primary and Secondary 24-Hour Standard – 35 µg/m^3

The 24-hour average standard is met when the three-year average of the annual 98th percentiles of the 24-hour averages does not exceed 35 micrograms per cubic meter (µg/m^3).



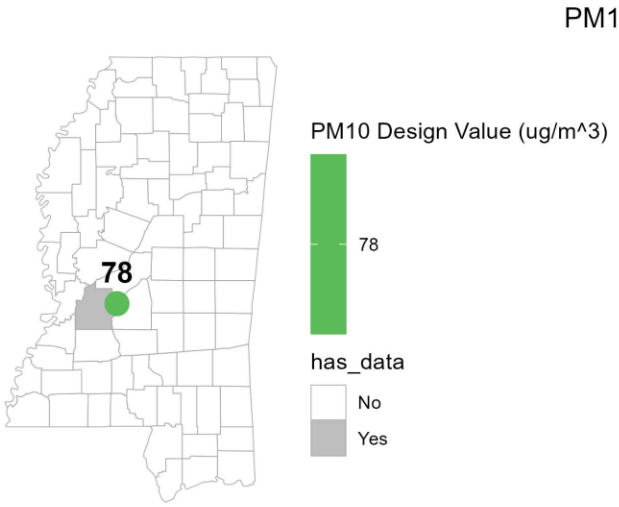
PM Site	County	Year	PM2.5 24HR 2022 Design Value
Cleveland Delta State	Bolivar	2022	19.8
Hernando	DeSoto	2022	19.1
Hattiesburg	Forrest	2022	21.1
Waveland	Hancock	2022	19.7
Gulfport Youth Court	Harrison	2022	18.9
Hinds CC	Hinds	2022	22.4
Jackson NCORE	Hinds	2022	21.7
Pascagoula	Jackson	2022	16.5

PM_{10} Standards

There is one primary and secondary PM_{10} standard - the 24-Hour Average. MDEQ monitors PM_{10} continuously at the N-CORE site located in Jackson.

Primary and Secondary 24-Hour Standard – 150 µg/ m^3

The 24-hour average primary and secondary standard is met when the annual second max does not exceed 150 micrograms per cubic meter (µg/m^3) over an average of three years.



PM Site	County	Year	PM10 2022 Design Value
Jackson NCORE	Hinds	2022	78

Carbon Monoxide

Carbon monoxide (CO) is a colorless, odorless gas that is formed when carbon in fuel is not burned completely. It is a component of motor vehicle exhaust, which contributes about 56% of all CO emissions nationwide. Other non-road engines and vehicles (such as construction equipment and boats) contribute about 22% of all CO emissions nationwide. Other sources of CO emissions include industrial processes, residential wood burning, and natural sources such as forest fires.

Carbon Monoxide Standards

There are two primary CO standards - (1) the 8-Hour Average and (2) the 1-Hour Standard. There are no secondary CO standards. MDEQ monitors CO continuously at the at the N-CORE site located in Jackson.

Primary 8-Hour and 1-Hour Standard – 9 ppm and 35 ppm, respectively

The 8-hour average standard is met if the 8-hour average of 9 parts per million (ppm) is not exceeded more than once per year. The 1-hour average standard is met if the 1-hour average of 35 parts per million (ppm) is not exceeded more than once per year.

CO 1-HR 2022 Design Value

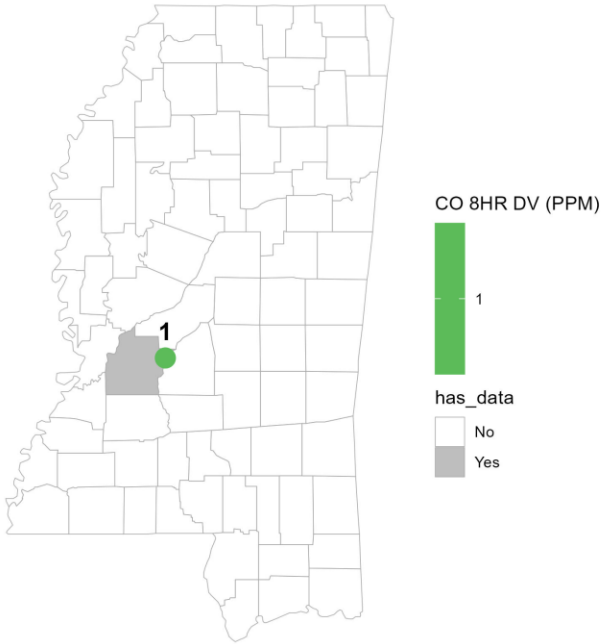
Jackson NCORE	Hinds	2022	1.3

CO 8-HR 2022 Design Value



CO Site	County	Year	CO 8-HR 2022 Design Value
Jackson NCORE	Hinds	2022	1

Nitrogen Dioxide

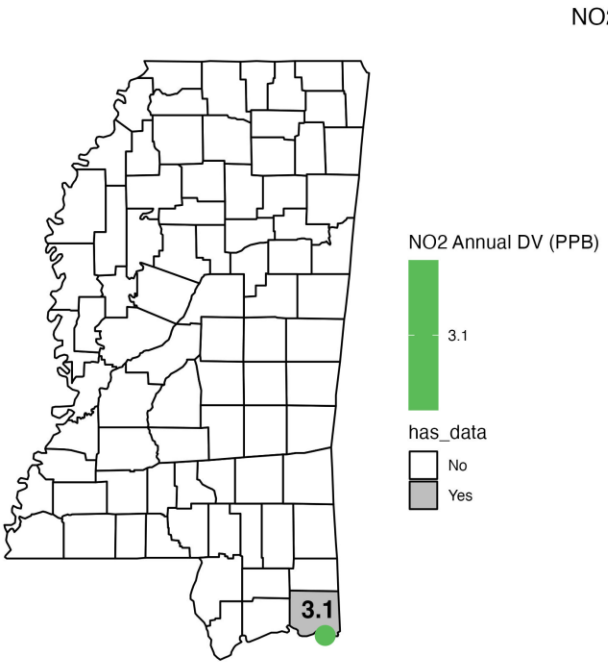
Nitrogen dioxide (NO_2) can often be seen as a reddish-brown layer. Nitrogen dioxide forms when fuel is burned at high temperatures, as in a combustion process. The primary manmade sources of nitrogen dioxide are motor vehicles, electric utilities, and other industrial, commercial, and residential sources that burn fuels. It can also be formed naturally.

Nitrogen Dioxide Standards

There are two NO_2 standards - (1) the Primary and Secondary Annual Average and (2) the Primary 1-Hour Average. MDEQ monitors nitrogen dioxide continuously at the monitoring site in Pascagoula.

Primary and Secondary Annual Standard – 53 ppb

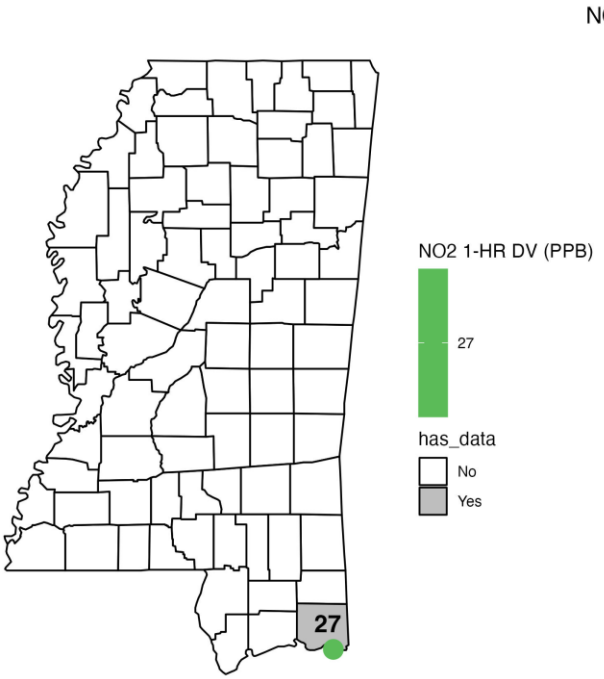
The annual average NO_2 standard is met when the annual average does not exceed 53 parts per billion (ppb).



NO2 Site	County	Year	NO2 Annual 2022 Design Value
Pascagoula	Jackson	2022	3.1

Primary 1-Hour Standard – 100 ppb

The 1-hour average NO_2 standard is met when the three-year average of the annual 98th percentiles of the 24-hour averages does not exceed 100 parts per billion (ppb).



NO2 Site	County	Year	NO2 1-HR 2022 Design Value
Pascagoula	Jackson	2022	27

Sulfur Dioxide

Sulfur dioxide (SO_2) belongs to the family of sulfur oxide gases (SO_x). These gases dissolve easily in water. Sulfur is prevalent in all raw materials, including crude oil, coal, and ore that contain common metals like aluminum, copper, zinc, lead, and iron. SO_x gases are formed when fuel containing sulfur, such as coal and oil is burned, and when gasoline is extracted from oil and metals are extracted from the ore. SO_2 dissolves in water vapor to form acid and interacts with other gases and particles in the air to form sulfates and other products that can be harmful to people and their environment.

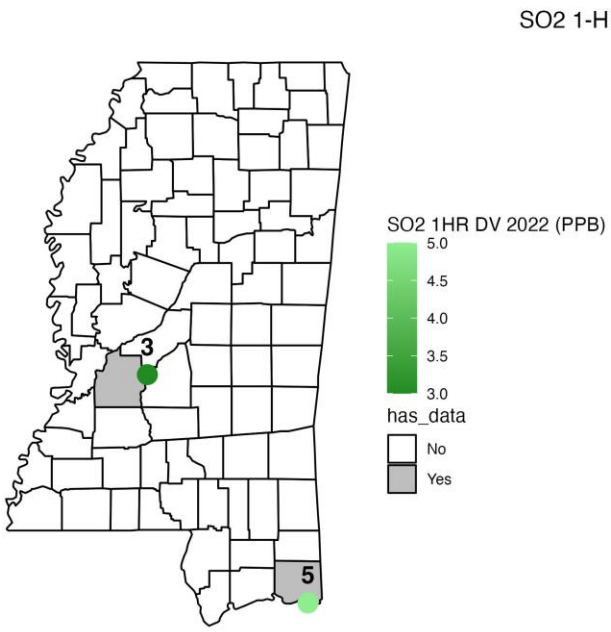
Over 49% of SO_2 released to the air comes from electric utilities, especially those that burn coal. Other sources of SO_2 are industrial facilities that derive their products from raw materials like metallic ore, coal, and crude oil, or that burn coal or oil to produce process heat. Examples are petroleum refineries, cement manufacturing, and metal processing facilities.

Sulfur Dioxide Standards

There are two SO_2 standards – (1) the Primary 1-Hour average and (2) the Secondary 3-hour average. MDEQ monitors SO_2 continuously at the monitoring sites listed below.

Primary 1-Hour Standard – 75 ppb

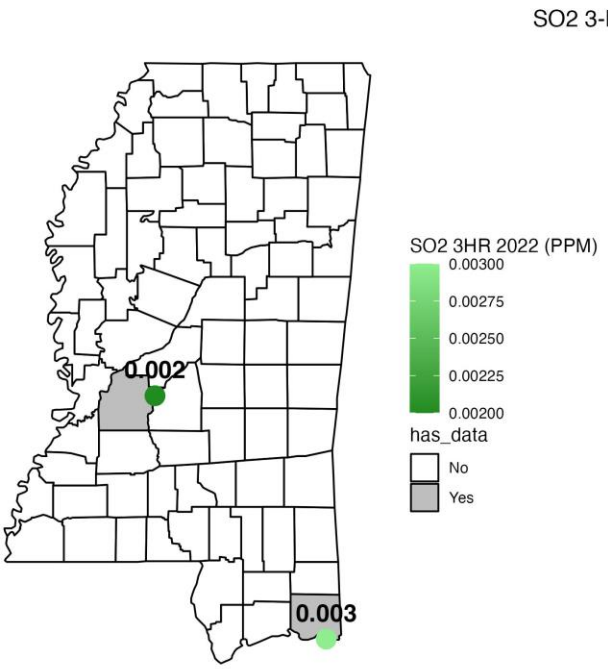
The 1-hour average SO_2 standard is met when the three-year average of the annual 99th percentiles of the 1-hour averages does not exceed 75 parts per billion (ppb).



SO2 Site	County	Year	SO2 1-HR 2022 Design Value
Jackson NCORE	Hinds	2022	3
Pascagoula	Jackson	2022	5

Secondary 3-Hour Standard – 0.5 ppm

The secondary 3-hour average SO_2 standard is met when the maximum 3-hour average concentration of 0.5 parts per million (ppm) is not exceeded more than once per calendar year.



SO2 Site	County	Year	SO2 3-HR 2022 Design Value

Data Completeness By Pollutant

8-Hour Ozone
Data Completeness

Standards

The standards for 8-hour ozone data completeness are:

- The daily maximum 8-hour average concentrations are available for at least 75%, on average, of the designated sampling days for any one year.

- The daily maximum 8-hour average concentrations are available for at least 90%, on average, of the designated sampling days for a three-year period.

Nitrogen Dioxide
Data Completeness

Standards

The standards for nitrogen dioxide data completeness are:

- An annual mean must be based upon hourly data that are at least 75% complete for the scheduled sampling days in each year.

- A 1-hour design value is valid if it encompasses three consecutive calendar years of complete data. A year meets data completeness requirements when all 4 quarters are complete. A quarter is complete when at least 75% of the sampling days for each quarter have complete data. A sampling day has complete data if 75% of the hourly concentration values are reported.
